The semi-permeable membrane is esp. used for ultrafiltration and inverse osmosis. The membranes have a high permeability to water, esp. 1,000-5,000 l/m²d. under pressure of 20 bars, and a high retention capacity for dissolved substances. The membranes are selective, having no retention capacity for inorganic salts, being used for removing certain organic substances from aq. solns. 2.9.77 as 039529 (13pp931)

Treatment of liq. effluents - by aerobic biological treatment at high load by a fixed biomass followed by physical and/or chemical purification

SOC GEN TECHN NOUV 05.07.78-FR-019981
(16.01.80) C02f-01/52 C02f-03/04 C02f-09

liq. effluent is purified by aerobic biological treatment at high load by a fixed biomass followed by physical and/or chemical purification treatment. Pref. the amt. of fixed biomass used is sufficient that the biological system operating at high load causes a 15-40% reduction in original BOD.

The process gives high purification yields and allows direct discharge of the prod. into the natural surroundings. The process is adapted to tolerate rapid variations in input of effluent. Investment costs are reduced since the need for intermediate decantation is avoided. The process can be used for urban or industrial effluent treatment. 4.7.79 as 023221 (5pp513)

LEI/★ D15 04079C/03 ★GB 2024-886
Absorption and filtration mat for waste liquids - comprises wet laid matrix contg. cellulose fibres and polymeric micro-bits

KLEIN M 07.07.78-US-922656
A97 F09 J01 (A13 A17 A25 A88) (16.01.80) D21h-03/40

The mat comprises a wet-laid, non-woven matrix composed of randomly arranged, irregularly intersection and overlapping particles, which include cellulose fibres to provide the wet strength of the matrix during the flat wet stages of mat prodn. and to retain the integrity of the mat under the tensile stress to be encountered in use.

Also present are micro-bits of non-brittle expanded polymer which is (a) polystyrene, (b) poly(2-6C)olefin, (c) melt alloy of polyethylene with 10 wt % polystyrene, (d) propylene-(20-30 wt %) ethylene copolymer (e) melt alloy contg. >50 wt % polypropylene and EVA copolymer (contg. 30% PVAc) or (f) expanded flexible polyurethane. The micro-bits provide the mat with the porosity and flow-rate level required. The matrix can also include PET fibres, finely divided activated carbon, diatomaceous earth and/or colloidal alumina monohydrate.

The mat is used to remove particulate and colloiddally dispersed and/or dissolved substances from liquids, partic waste industrial effluent. 4.7.79 as 023251 (11pp1319)

Liq. sewage treatment using a small amount of hypochlorite - in a low cost installation which does not require petroleum fuels

OIKAWA S 30.03.78-JA-037001

E34 (30.11.79) C02c-01/40 C02c-05/04

Polluted water is subjected to deodorisation, sterilisation and purification by (i) adding hypochlorite soln. and (ii) stirring and allowing to stand, so that the water is made milky and sepd. into a transparent aq. layer and sediment. The water is completely deodorised in this state.

The odour source in the polluted water (e.g. H₂S, NH₃, ammonium acetate, methylmercaptan or acetoamide) is reacted with the hypochlorite and converted to give an odourless stable substance. N₂ is also obtained and discharged. Bacteria existing in the water are completely exterminated so that the pollution problem is completely solved. 30.3.78. as 037001 (2pp34)

SHOW★ D15 04123C/03 ★J5 4152-350
Treatment of waste liquor contg. sodium thiosulphate - by oxidn. in an alkaline state using oxygen contg. gas

SHOWA DENKO KK 22.05.78-JA-060062

E34 (30.11.79) C02c-05/04

Sodium thiosulphate contained in waste liquor discharged from a chemical plant is converted by oxidation to Na₂SO₄ without any generation of SO₂ and deposition of sulphur by oxidising it with O₂ or O₂-contg. gas under alkaline conditions (with NaOH) in the presence of an excess amt. of Na₂SO₃. The reaction mechanism is as follows:

Na₂S₂O₃ is oxidised to Na₂S₄O₆ which is then converted to Na₂S₃O₆ and Na₂S₂O₃ in the presence of Na₂SO₃. Then, Na₂S₃O₆ is converted to Na₂S₂O₃ and Na₂SO₃ in the presence of NaOH and Na₂SO₃ thus produced is oxidised with oxygen to harmless Na₂SO₄.

Up to 98% of the thiosulphate is removed in the presence of an excess amt. of Na₂SO₃, and further the remaining excess amt. of Na₂SO₃ is almost completely removed in this process. In conventional processes where H₂SO₄ is used, sulphur is deposited and SO₂ is generated as follows: H₂SO₄ + Na₂S₂O₃ → Na₂SO₄ + H₂O + SO₂↑ + S. 22.5.78. as 060062 (3ppW34)

Nitrification suppression in aerophilic activated sludge treatment - by controlling the rate of aeration automatically as a function of the redox potential

NIPPON STEEL CORP 20.05.78-JA-060444

(30.11.79) C02c-01/02

Organic pollutants are removed from effluent contg. organic pollutants and ammonium cpds. e.g. sewage, or industrial effluents by aerobic activated sludge treatment. The improvement comprises controlling the redox potential of the aeration vessel within +50 to +150 mV. The nitrification reaction is largely suppressed and simultaneously the degradation of organic pollutants is carried out smoothly.

Process takes place without the flotation or outflow of sludge from the settling vessel which are due to rapid formation of nitrogen oxides and without inhibition of the function of BOD bacteria.

The redox potential of the aeration vessel can be controlled by varying the aeration rate, amt. of pollutants admitted, concn. and activity of sludge, temp. and by pH etc., but the aeration rate and the amt. of pollutants admitted are most easily controlled by automation. The latter is not desirable as the loading of pollutants w.r.t. activated sludge varies and so the aeration rate is pref. automatically adjusted by feedback from the redox potential. 20.5.78. as 060444 (4pp34)

purifying waste warm water for reuse in power plants, etc. - by removing scaling components with a mixt. of hydrous ferric oxide and synthetic zeolite

ASIA GIJUTSU CONSUL 24.05.78-JA-060914
(05.12.79) C02b-05

In the recycling of waste water at 90-100°C, resulting from subterranean power plants or waste heat-utilising power plants, to a well after utilisation of heat, the improvement comprising contacting it with a mixt. of Fe₂O₃·H₂O and synthetic zeolite produced from kaolin-type waste alumino-silicate (SiO₂·Al₂O₃·2H₂O) and waste silica to remove scaling components, e.g. SiO₂, SO₄²⁻, PO₄³⁻, Na⁺, Cl⁻, Mg²⁺, Ca²⁺ etc. by ion-exchange prior to recirculation, so that blinding of the well is prevented even without cooling the waste water.

The ion exchanged synthetic zeolite sepd. from the waste water in a cooling or filtration vessel is used as a road material, etc. 24.5.78. as 060914 (3pp34)

HITK ★ D15 04368C/03 ★J5 4154-155
incineration of chromium-contg. sludge from aq. waste - is carried out in presence of calcium cpd., to prevent dissolution of hexavalent chromium from incinerated ash

HITACHI METAL KK 25.05.78-JA-062463
E31 (05.12.79) C02c-03

The incineration of Cr-contg. sludge, e.g. resulting from treatment of municipal sewage and aq. industrial waste etc., is carried out in the presence of a Ca cpd., e.g. Ca(OH)₂, CaO and CaCO₃ etc., so that dissolution of hexavalent Cr ion from incinerated ash is prevented. Hence it is not necessary to provide any special means for creating a reducing atmosphere in the incinerating furnace.

In an example, Ca(OH)₂ is added to a sludge contg. 5,000 ppm Cr component (obtd. from treatment of aq. plating waste) in amts. > 40 wt. % (21.6 wt. % calculated in terms of Ca). The mixt. is incinerated at 800°C for 1 hr. in an electric furnace, and dissolution of Cr⁶⁺ is hardly observed.

Generally, formation of Cr⁶⁺ in the incinerated ash increases in accordance with increase of the Ca component in the sludge but Cr⁶⁺ formation reaches a max. when the amt. of Ca(OH)₂ approaches 25 wt. %. Then Cr⁶⁺ formation is gradually decreased, even when increasing the amt. of Ca(OH)₂ to be added, and it is hardly observed when the amt. of Ca(OH)₂ to be added is > 40%. 25.5.78. as 062463 (2pp34)

KAWI ★ D15 04369C/03 ★J5 4154-157
Treatment of effluent contg. thiosulphate, etc. - includes addn. of acid to adjust pH before retention of effluent and addn. of oxidising agent

KAWASAKI STEEL KK 24.05.78-JA-061021

E36 M24 (05.12.79) C02c-05/04

Effluent contg. S₂O₃²⁻, S²⁻, SO₃²⁻ etc., esp. aq. material from blast furnace slag in steel plant is subjected to chemical oxidn. treatment to reduce its COD value. The improvement comprises addn. of org. and/or inorg. acid to adjust its pH to a predetermined value, pref. < 2, and subjecting the effluent to retention treatment for 2-3 hrs. to decompose by oxidn. S₂O₃²⁻ etc., followed by addn. of oxidising agent, e.g. NaClO, and Cl₂ etc., so that the amt. of the oxidising agent is reduced.

In an example, water having COD of 200 ppm is transferred to a pH-adjusting vessel to which 1,450 ppm H₂SO₄ is added to adjust pH to 1.5, followed by retention for 3 hrs. under conditions to decompose by oxidn. the COD component. Thereafter, 926 ppm of Cl₂ is added, followed by retention and adding 1,410 ppm NaOH for neutralisation. The COD content was < 15 ppm, and remaining Cl₂ content was < 10 ppm. 24.5.78. as 061021

KATS/ ★ D15 04370C/03 ★J5 4154-158
Treatment of heavy metals-contg. effluent - by contacting with shaped prod. obtd. by mixing aluminium hydroxide and/or oxide with insoluble calcium salt and heating

KATSUKAWA H 26.05.78-JA-062002

A81 J01 M12 (05.12.79) B01d-15 C02d-05/02

Heavy metal component(s), e.g. Fe etc. are effectively removed from effluent, e.g. pickling effluent etc. by contacting it with a shaped prod. obtd. by mixing Al(OH)₃ and/or Al₂O₃ with insoluble Ca salt in wt. ratio of 3/1-1/3 and heating it at 100-450°C to adsorb the heavy metal component(s) (oxidn. of the heavy metal component(s) occurs simultaneously), and subsequently sepg. the heavy metal component(s) by mechanical means.

The adsorber used in this process is produced easily and more economically than ion exchange resin, and is easily regenerated mechanically without any use of regenerating chemicals as in the case of the ion exchange resin.

In an example, paste-like Al(OH)₃ and CaSO₄ are mixed together in molar ratio of 1:1, after which 30 gms of PVA (binder) is added to 900 grams of the mixt. followed by mixing together and shaping into pellets having a dia. of 5 mm and drying at 200°C for 2 hrs. to give an adsorber. 26.5.78. as 062002 (3pp34)

Waste water treatment using acclimatised activated sludge - esp. useful where COD and BOD of the water varies

MITSUBISHI CHEM IND KK 30.04.77-JA-049674
(15.12.79) *J53135-171 C02c-01/06

Waste water treatment by activated sludge subjected to acclimation uses an aeration tank contg. mixed waste water contg. ≥ 3500 mg/l. sludge. Process comprises starting acclimation of the activated sludge under the COD-loading of max. 0.3kg/kg. -sludge/day, increasing the amt. of the activated sludge by 20-100% after the rate of COD-removal from the waste water becomes mainly constant; and continuing treatment with thus acclimated sludge.

Used for treatment of factory effluents and city sewage esp. for waste water whose BOD and COD varies with time.

For the activated sludge treatment aeration of O_2 or air may be by mechanical means or with an air diffuser. The amt. of sludge is pref. $\geq 4,000$ mg/l. Sludge generated in excess at a city sewage or an industrial waste water treating plant can be used. Mixts. of sludge from various sources can also be used. The COD-loading of ≤ 0.3 kg/kg. sludge/day is maintained for 6-100 hrs. pref. 24-48 hrs. 28.4.77 as 049674 C02c-1/06 (15.12.79) MITSUBISHI CHEM IND KK (4pp) (J5 3135171)

Water softener with regeneration controlled by plunger valve - also
giving pulsating action during brining controlling brine dilution

BRASWELL JW 12.06.78-US-914512 (24.06.76-US-699215)

(01.01.80) B01d-23/24

A water treatment system includes an ion-exchange min-
eral bed in a tank. A plunger valve regulates the function
of the bed to provide "service", "brining", "flushing"
and "brine refill" operations. The valve also provides a
pulsating action during a brining and rinse cycle to alter-
nately introduce brine and diluted brine into the bed.

The plunger valve includes an aspirator which draws
brine from a brine tank and also draws liquid from the
treatment tank during the regeneration operations.

The single plunger valve controls the regeneration of
the mineral bed. 12.6.78 as 914512 C.i.p. 4104165
(10pp295).

Waste water treatment process to remove bod - using fluidised bed of microorganisms attached to solid particles

ECOLOTROL INC 20.06.78-US-917162 (12.07.74-US-487974)

(08.01.80) C02c-01/04

Process uses a fluidised bed of acid-forming (including methane-forming) micro-organisms attached to a solid particulate carrier. The waste water is passed continuously through the bed where it is retained for a time at a sufficient temp. and with the bed under anaerobic conditions, to remove the BOD and to produce methane gas, CO₂ and cellular material. The gases are continuously removed, and excess cellular material is removed from the particulate carrier to leave merely a thin layer of the microorganisms.

The process is used to treat waste water with about 50 mg./l. BOD. It may also be adapted to treat water with a BOD of >200 mg./l. The process will also remove nitrates, nitrites or other oxidised contaminants. The process requires lower retention times than traditional methods. 20.6.78 as 917162 (+18.11.75; 4.11.76-633153; 738867) (8pp295)

Ozone production in chemo-nuclear generator - esp. for waste or water treatment, using radioactive material in oxygen flow tubes

GARCIA R I 08.06.78-US-913699

E36 K08 (10.01.80) B01j-01/10 C01b-13/10 G21g-01/12 G21h-05 D/S: N(BR, JA, SU) + E(CH, DT, FR, GB, LU, SW).

Ozone is produced in a chemonuclear generator having a number of parallel spaced tubes. Nuclear fuel emitting particles of energy greater than SeV is placed in the tubes, which are made partly of fluorescent material.

Oxygen-containing material flows through some of the tubes and ozone formation takes place. A coolant liquid is passed over the generator tubes.

The method may be used in processes for treating waste streams or drinking water.

Ozone is produced cheaply, since spent fuel or other material from nuclear power plants or reprocessing plants can be used.

D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, OE, SW).

Prod. of a selected protein is carried out by (a) cleaving the bacterial gene for an extracellular or periplasmic carrier protein; (b) inserting a non-bacterial DNA fragment, which codes for the selected protein, into the cleavage site by a recombinant step; (c) transforming a bacterial host with the recombined gene; and (d) culturing the bacteria to excrete the selected protein.

The process may be used to produce eukaryotic cell proteins (e.g. insulin, human growth hormone or interferon), viral antigens (for vaccine prodn.), and industrial enzymes.

The use of extracellular or periplasmic carrier proteins avoids contamination of the product with other proteins within the bacterium and avoids degradation of the product by intracellular enzymes.

Conditioning fragmented cellulosic materials esp. wood - in solid medium using microorganisms with air circulation

KUCZEWSKI DE PORAY 30.03.78-FR-009339

A81 C05 F09 P63 (D13) (30.11.79) B27k-05 B27k-09 B27l-03 B29j-05 C12b-01/16

The pecto-ligno-cellulosic materials of vegetable origin are treated in solid medium with the aid of exothermic biochemical reactions using aerobic or anaerobic microorganisms. The materials are seeded with $\gg 1$ inoculum of a specific strain of microorganisms and introduced into a fermenter. The fermentation is controlled by circulating air through the materials at a rate such that the temp. in the middle of the material is maintained at the optimum growth rate temp. of the specific strain. The process is carried out in an appts. comprising a fermentation chamber fed with air by a distribution appts. which feeds the air at different levels.

The process is applied to leaves, plants, forest prods. esp. wood. The agglomerated prod. can be used to make panels, moulded elements, papers, cargons, agro-food prods., and combustible briquettes. The process enables the fermentation time to be reduced to a min. 30.3.78 as 009339 (22pp597)

L-amino acid and carbon source determ. in fermentation broths - using a microbial electrode sensitive to carbon dioxide released by decarboxylation or oxygen consumed

AJINOMOTO KK 31.05.78-JA-065380 (28.03.78-JA-035906)

A89 B05 J04 R16 (30.11.79) C12b-01 G01n-27/26 G01n-33/16

Process for determination of the concentration of a carbon source or of an L-amino acid in a soln. such as a culture medium or a cultivated broth.

The process comprises (a) contacting the soln. under aerobic conditions in the case of C source or anaerobic conditions in the case of an L-amino acid, with a microbial electrode comprising fixed microbial cells or immobilised microorganisms and an electrode sensitive to O_2 in the case of a carbon source or an electrode sensitive to CO_2 dioxide in the case of an L-amino acid; these immobilised microorganisms or microbial cells being capable under aerobic conditions of metabolising the C source and consuming the O_2 oxygen in the soln. or under anaerobic conditions of decarboxylating the L-amino acid and liberating

O₂ in the soln., (b) electrochemically measuring the speed of redn. of the current or of the redn. of the current at a stationary state by following the O₂ consumption by the microorganisms or microbial cells, in correspondence with the C source concn. or measuring the EMF produced by release of CO₂ due to decarboxylation by the microorganisms or microbial cells in correspondence with the concn. of L-amino-acid and (c) determining or recording the concn. of the carbon source or of the L-amino-acid in the soln.

Rapid simple quantitative determ. is obtd. allowing easy control of C source concn. so as to give optimum growth of the prod., e.g. L-glutamic acid, concn. Typical C sources include glucose, fructose, saccharose, acetic acid, methanol, etc., and typical L-amino-acids are glutamic acid, lysine, phenylalanine, arginine, etc. 23.3.79 as 007818 (41pp395)

Easily digestible yeast bodies prodn. - by culturing yeast of high dyeing property

AJINOMOTO KK 03.03.75-JA-025076

(18.12.79) *J51101-189 C12k-01/02 + A23k-01 C12c-11/18

Easily digestible yeast bodies are prepd. by culturing yeast of high dyeing property in usual culturing medium and collecting yeast bodies. Though the yeast stock of high

dyeing property can be obtd. without particular treatment to obtain varieties, the treatments by usual physical and chemical means, are effective to obtain varieties with high efficiency.

The yeast stock which usually forms white, milky white or yellow colony on the agar medium without pigment, usually forms pale pink colony on the medium added with rose Bengale and sky blue colony on the agar medium added with aniline blue. The varieties which form red colony on the rose Bengale medium or dark blue colony on aniline blue medium are appeared, and yeast bodies are recovered by culturing those varieties.

When the artificial digestive ratio with pepsin in measured on dry yeast bodies obtained, those of yeast stocks of high dyeing property are superior to usual yeast stocks by 10-40%. Further yeast stocks of high dyeing property often give yeast bodies of high coagulating property, and the sedimentation speed of yeast bodies is remarkably increased. 3.3.75 as 025076 C12k-1/02, C12c-11/18, A231-1/00 (18.12.79) AJINOMOTO KK (3pp) (J5 1101189)

Food grade citric acid microbiological prodn - includes stagewise submerged aerated fungal producer strain culturing using specified amts. of sugar

LENGD FOOD IND RES 09.03.77-SU-461713
E17 (30.04.79) C12d-01/04

Citric acid is produced by deep cultivation of a fungus (e.g. *Aspergillus niger*) with aeration. The well developed mycelium is introduced into a soln. contg. a carbohydrate, e.g. molasses; after the completion of the fermentation, the citric acid is sepd.

This process is accelerated by carrying out the development of the mycelium stepwise in a series of fermenters. In each fermenter, the concn. of sugar is increased by 1.5-2%; pref the sugar concn. in the first fermenter is 2.5-3.5%, in the second fermenter 4.5-5.5%, in the third 6.5-7.5%. The vol. of the medium increases in such a manner that in the preceding fermenter the vol. amounts to 10-15% w.r.t. the vol. in the next fermenter.

The initial sugar concn. in the molasses is 8.5-10%. Molasses solns. having relatively high sugar concn. can be utilised.

L-aspartic acid prodn. for use in food or medicine - by *Escherichia coli* bacterial strain producer cell immobilisation in polyacryl amide gel, activation by heating and specified extrn.

MOSCOW LOMONOSOV UNIV 09.02.77-SU-451483
A97 B05 E16 (A14) (30.04.79) C12d-13/06

L-Aspartic acid is produced by cultivating *Escherichia coli* in a nutrient medium; sepg. the cells from the culture liq-uid; washing the cells; immobilising the cells in a polyacryl-amide gel; comminuting the gel; activating the cells and eluting with an aq. ammonium fumarate soln. This process is intensified by using *Escherichia coli* strain 83 or Ah52 or 85. The activation is carried out by heating a cell suspension at 45-55°C for 40-60 min.

The immobilisation of the cells is carried out in presence of a salt of aspartic acid (3-9 wt. %). Subsequently, the cells are cooled to 0-10°C whilst irradiated with visible

light (intensity 15,000-20,000 lux) for 5-10 min.

Prodn. of beta-galactosidase for medical purposes - includes growing *Curvularia inaequalis* microbial strain in nutrient contg. soya grist and ultrafiltration using cellulose acetate membrane
LENGD ANTIBIOTIC 06.05.76-SU-357215

A88 (A11) (30.04.79) C12d-13/10

β-Galactosidase is produced for medical purposes by deep cultivation of 7 *Curvularia inaequalis* in a nutrient medium with aeration; the product is then sepd. from the culture liquid.

The yield of the product is increased and its activity is enhanced by carrying out the cultivation in presence of 1-2 wt. % (w.r.t. the nutrient medium) of soya grist. The product is sepd. from the culture liquid by adsorption on highly dispersed cationite. The desorption is carried out with a citrate buffer. The soln. is then subjected to ultrafiltration through a cellulose acetate membrane (pore size 80-150 Å) at pH 4.2-7.0; followed by lyophilic drying. The activity of the β-galactosidase soln. is increased from 1-2 to 3-4 units/ml.

Saccharomyces vini yeast strain - used in prodn. of late crop apple wine and cider at high fermentation rate

AS UZB MICROBIOL 19.05.77-SU-489456

(15.05.79) C12g-01 C12k-01/02

Saccharomyces vini UZ-Yas-1 yeast strain is used in the prodn. of apple wine and cider. It is described as new.

The strain has high fruit juice fermentation activity and it is resistant to changes in local climatic conditions. It can be used in the fermentation of late crop apple juice at increased fermentation rate giving prod. with increased alcohol content and improved flavour.

Prophylactic anti-chlamydiosis vaccines for farm animals and poultry - produced using strain Chlamydia equis B-73 having good immunogenicity and reduced virulence

N CAUCASUS VET RES 03.10.77-SU-528672
B04 C03 (15.05.79) C12k-05

Strain chlamydia equis B-73 is used for the prepn. of prophylactic anti-chlamydiosis vaccines for farm animals and poultry.

This strain was sepd. from an aborted foal; adapted to chicken embryos; passed through organisms of white mice and then, 32 times, through yolk envelopes of 7-day old chicken embryos. By this method, the virulence of the strain was diminished without affecting its immunogenic properties. The strain is kept at the North-Caucasian Veterinary Institute.

Antigenically modified influenza virus strain - obtd. by culturing parent viral strain in passively immunised chick embryo using specified serum

ODESS VIROLOGY 22.03.73-SU-897261
B04 C03 (15.05.79) C12k-07

Antigenically modified influenza virus strain variant is obtd. by injecting chick embryo with influenza virus immune serum and corresp. viral strain, followed by incubation and prod. sepn. The virus immunogenic characteristics are stabilised if the chick embryo is preliminary passively immunised with serum which is immune to all type of influenza virus and, 24-48 hrs. later, adding influenza virus strain in 106 x 10⁹ viral count dose.

The method prevents the change of viral strain variant into its parent strain type.

Softening tough parts of mushrooms - by incubating in acidic salt soln. opt. with addition of enzymes

SCHMITZ H 05.06.78-DT-824553
(D13) (10.01.80) *DT2824-553 A23b-07/10 A23l-01/28
D/S: N(DK,JA,SU,US).

Prod. of soft, edible fungal fruiting bodies (or their parts) from tough fungal material, rich in softening enzymes, comprises treating the material with an acid soln. of pH 3-5.5 and salt concn. 0.02-0.5M at $20-55^\circ\text{C}$ for 0.5-10 days. The treatment may be under aerobic or anaerobic conditions.

Pref. the acid soln. is a pH4 acetic, citric or lactic

acid buffer, or an acid whey made by fermentative milk acidification. The fungal material may be fresh or stored for up to 2 years at -2° to -40°C.

A similar process can be used with fungal material of low softening enzyme content if combined with treatment with glucanase and chitinase (supplied e.g. as an extract of enzyme-rich fungi).

Protein prodn. from bacterium contg. recombined gene - derived from gene for extracellular or periplasmic protein

HARVARD COLLEGE 08.06.78-US-913533

B04 (10.01.80) C12d-21/20 C12n-15 C12p-21/02

D/S: N(BR).

Prodn. of a selected protein is carried out by (a) cleav-

ing the bacterial gene for an extracellular or periplasmic carrier protein; (b) inserting a non-bacterial DNA fragment, which codes for the selected protein, into the cleavage site by a recombinant step; (c) transforming a bacterial host with the recombined gene; and (d) culturing the bacteria to excrete the selected protein.

The process may be used to produce eukaryotic cell proteins (e.g. insulin, human growth hormone or interferon), viral antigens (for vaccine prodn.), and industrial enzymes.

The use of extracellular or periplasmic carrier proteins avoids contamination of the product with other proteins within the bacterium and avoids degradation of the product by intracellular enzymes.

7.6.79 as US0399 (19pp367).

 Topical or rectal compsns. contg. medicament - together with urea adduct and solid powder
 SOC RECH PHARM SA 16.06.78-GB-027115
 B07 (09.01.80) A61k-09/02
 D/S: E(BE, CH, DT, FR, GB, IT, NL, SW).

Pharmaceutical compsns. comprise (a) an effective amt. of a medicament; (b) 5-40% of small particles of an inclusion cpd. of urea with one or more 4-30C straight-chain aliphatic cpds.; (c) $\leq 50\%$ of a powder which is inert to and insoluble in the other ingredients; and (d) 25-90% of a carrier which does not dissolve or react with components (a)-(c), opt. together with a thickener. Components (a)-(c) are dispersed in component (d).

The compsns. are esp. useful for topical or rectal administration of water-sensitive medicaments (e.g. corticosteroids and derivs., dithranol for the treatment of psoriasis, salicylates for the treatment of rheumatic conditions, griseofulvin, nystatin, miconazole, tolinaftate, undecanoic acid and related antifungal agents, glycyrrhithinic acid and salts thereof and related antiinflammatory agents, ephedrine and related vasoconstrictors, vasodilators, antibiotics such as tetracycline, erythromycin and clindamycin, and sun-screening preps. comprising mixts. of vitamins A and D). The compsns. have good storage stability and a smooth texture; the urea assists percutaneous transport of the medicament and, in some cases, potentiates its effect.

Saccharine-free dentifrice compsn. - contg. neo:hesperidin di:hydro-chalcone, naringin di:hydro-chalcone and ascorbic acid (deriv.)

SUN STAR HAMIGAKI K 25.05.78-JA-062991

B02 E13 (B03 D13) (05.12.79) A61k-07/16

Saccharin-free dentifrice composition is prepd. by combining neohesperidin-dihydrochalcone, naringin-dihydrochalcone, and ascorbic acid in conventional dentifrice base.

In dentifrice composition saccharin has been mainly used as the sweetener to suppress the basic smell originated from other ingredients, but recently its use has been a problem from the viewpoint of safety. The inventor has found that through the sweetness of neohesperidin-dihydrochalcone and naringin-dihydrochalcone has defects in taste and aftertaste, they show excellent refreshing sweetness synergistically together and that the pink-colouration of the dentifrice composition due to their application, can be prevented by adding ascorbic acid or its deriv.

Usually neohesperidin-dihydrochalcone and naringin-dihydrochalcone are combined 0.02-0.05 wt. % and 0.02-0.075 wt. % respectively in compsn. and ascorbic acid or its derivative (e.g. L-ascorbic acid, its salt and its ester) is combined 0.05-0.50 wt. % in compsn. 25.5.78. as 062991 (4pp5)

Composite splint for positioning patient's lower leg and ankle - comprises tubular pads hooked together and filled with hardenable plaster or polyurethane foam

EUROCOM EST 27.06.78-DT-828098

A96 F07 P32 (10.01.80) A61f-13 06

Legging adapted to cover a person's foot and leg near the ankle joint and fix it in the rest position at a pre-determined angle whilst preventing pivoting motion of the ankle joint is claimed.

The legging is composed of 2 tubular communicating

sections along whose longitudinal edges one half-tape of a closure, e.g. a slide fastener closure, burr-type closure or hook-and-eye closure is fixed. These half closures enable the legging to be fixed together after the tubular sections have been filled with plastically deformable but hardenable material. The sections, thus hooked together, form a demountable split about a person's leg when the packing inside the tubular sections has set. Plaster or curable polyurethane foam is a suitable packing. 27.6.78 as 828098 (28pp267)

A96 P21 (30.11.79) A41b-13/02

Method comprises placing uniformly water-insoluble and hygroscopic and swelling powdery polymer in sprinkled state between a water-permeable sheet and a waterproof sheet, bonding the two sheets by a water-insoluble adhesive applied onto the inner face of ≥ 1 of the sheets so as to surround the powdery polymer, and bonding the circumferential parts of the two sheets in belt form.

The simple and disposable diaper using powdery polymer of high water absorbing and retaining power is very suitable for absorbing excrements of baby, patient, etc. without causing leakage of absorbed matters.

Water-permeable sheet and waterproof sheet are e.g. nonwoven cloth consisting mainly of hydrophobic fibre such as polyacryl, polyester, polyamide, etc. or rayon paper. Powdery polymer is e.g. starch-modified carboxymethyl cellulose, modified polyvinyl alcohol, etc. 20.5.78. as 060364 (3pp)

Gas deodorising appts. - regulating of washed gas before treating with ozone and contacting with active carbon

TOKYO SHIBAURA ELEC LTD 23.05.78-JA-060577

E36 J01 (01.12.79) B01d-53/34

This appts. comprises a washing means for contacting a gas to be treated containing a foul-smelling component with a water, a heater for regulating the humidity of the gas after washing, and a reactor for contacting an active carbon filling layer with the gas to be treated which is mixed with the ozone.

NH₃ and fatty acid may be effectively removed from the gas thus preventing air pollution. It is possible to prevent the deterioration of the active carbon due to the sulphur cpd. in the reactor. The foul smelling components may be efficiently removed from the gas to be treated in the reactor because the humidity in the gas is regulated. 23.5.78. as 060577 (3pp35)

Absorbent for removal of obnoxious fumes - e.g., ammonia, tri:methylamine, hydrogen sulphide and mercaptan, prepd. from alkene-sulphonic acid, active carbon and acid or base

UNITIKA KK 24.05.78-JA-062426

J01 (01.12.79) B01d-53/02

Adsorbent consists of 1-30 pts. of α -olefin sulphonic acid (A), 1-50 pts. wt. of an inorganic acid or base (C), and 100 pts. wt. of additive carbon.

The base is NaOH, KOH, Mg(OH)₂, Ca(OH)₂, Zn(OH)₂, Na₂CO₃, K₂CO₃ or CaCO₃. The acid is phosphoric acid, (meta)phosphoric acid, polyphosphoric acid, sulphuric acid, nitric acid, hydrochloric acid, boric acid, or carbonic acid.

In an example, 10 g of sodium olefinsulphonate was dissolved in 10 ml of water to obtain an aq. soln. (1) 10g of NaOH was dissolved in 50 ml of water to obtain an aq. soln. (2). (1) and (2) were mixed 100 g of active carbon was immersed in the mixed soln. for 60 mins., and dried at 105°C for 30 mins. and at 150°C for 3 hrs. to obtain the adsorbing agent. 24.5.78. as 062426 (3pp51)

METE ★ D22 04343C/03 ★J5 4153-886
Water-absorbing sheets used as diapers etc. - contain water-swelling resin grains and small and large dia. thermoplastic resin grains, and water absorbing base sheets

METERU KK 25.05.78-JA-062575

A94 P21 P32 P73 (A96) (04.12.79) A41b-13/02 A61f-13/16 B32b-05/16 B32b-27/10

Water-absorbing sheets are obtd. by inserting (1) nearly 100 pts. of water-swelling resin grains, (2) 50-0.01 part of thermoplastic resin powders of average grain diameter of 100-1000 μ and (3) 100-0.01 part of thermoplastic resin powders having an average grain diameter of $< 70\mu$ between water-absorbing base sheets, and hot-melting

the thermoplastic resin powders.

Component (I) comprises mainly modified starches such as polyacrylic acid type graft copolymers, carboxymethyl starch. Components (2) and (3) include, e.g. vinyl chloride, polyethylene, polypropylene, acrylic type resins.

As the present sheets have large adhesive points comprising thermoplastic resin powders of a small grain dia. water-swelling resin grains are fixed before water-absorption, and even after water-absorption migration of swollen resin grains is prevented effectively. The sheets are used as paper diapers and menstruation aids. 25.5.78. as 062575 (3pp136)

OKAD-★ D22 04466C/03 ★J5 4154-528
Solid granular deodorant - contg. glyoxal and aluminium sulphate in an amt. sufficient to solidify the glyoxal

OKADA FUSENZAI KAGA (DAIL) 24.05.78-JA-061944

E17 P34 (E33) (05.12.79) A611-09/*

Solid deodorant contains as essential component glyoxal and Al sulphate to solidify the glyoxal. Since the deodorant is used in granular form, it is possible to use the deodorant in combination with other solid form deodorant. The amt. of Al sulphate used is 0.5-3 times the wt. of 40% glyoxal aq. soln.

In an example, 2500 g of 40% glyoxal aq. soln. is added to 2500 g of anhydrous Al sulphate, and the mixt. is kneaded at 50-60°C so that the mixt. becomes paste-like. The paste is granulated and dried at 5-60°C to obtain 3800g of solid deodorant. 24.5.78. as 061944 (5pp108)

OKAD-★ D22 04467C/03 ★J5 4154-529
Deodorant, used as granules or aq. soln. - contains the reaction prod. of glyoxal and urea as active component

OKADA FUSEN KAGA (DAIL) 24.05.78-JA-061945

E16 P34 (05.12.79) A611-09/*

The deodorant can be dissolved in water for use. The granules do not become misshapen, even when contacted with air contg. moisture, and are resistant to mechanical impact. Pref. 0.1-2 moles glyoxal and 0.2-1 moles urea are used. Sodium sulphate, sodium carbonate, aluminium sulphate, citric acid, activated carbon surfactant, fungicide, aroma and pigment can be added. When using the deodorant in the form of an aq. soln. the reaction prod. must be not too viscous.

In an example, 200g urea and 500g 40% glyoxal aq. soln. are mixed at 40-50°C with stirring until complete dissolution. The soln. is added to 4,300g anhydrous sodium sulphate, and the mixt. is kneaded at 50-60°C to evaporate water. This gives 4,780 g glyoxal-urea reaction prod. contg. sodium sulphate. This is granulated and dried at 50-60°C to give the solid deodorant. 24.5.78. as 061945 (6pp108)

Plastic bottle with sealed closure - including sealed primary and overcaps and screwed outer ring, used for storing and dispensing sterile liq.
BAXTER TRAVENOL LAB 31.07.78-US-929096 (14.03.77-US-777749)

Q33 (01.01.80) B65d-41/32

A thermoplastic bottle has a primary cap closing the dispensing outlet and having a thin frangible section adjacent the outlet. An overcap covers the primary cap and has an area fused to a transverse abutment surrounding the bottle neck. This also has a thin frangible section in the fused zone. An overring is screwed onto the overcap. This overlies the transverse abutment.

Interlocks limit relative axial movement between the primary cap and overcap. Relative rotation movement of the overcap and bottle neck is also limited. Rotation of

the outer ring against the transverse abutment moves the overcap axially upwards to sever the frangible sections.

Both the primary cap and overcap are hermetically sealed by fusing to the bottle neck. The closure is tamper-proof as the seals must be fractured to remove the caps and tampering is easily detected. 31.7.78 as 929096 C.i.p. 4111325 (+23.1.78 - US - 871320) (5pp295).

Ozone prepn. from oxygen - by UV irradiation of oxygen dissolved in inert dielectric liq. solvent

VASEN V A 13.03.78-US-885956

E36 J01 P34 (08.01.80) A61f-01 B01j-01/10

O₃ is produced by (a) injecting a dissolving vessel with an inert dielectric liq. having an affinity for O₂ dissolution, (b) mixing gaseous O₂ with the liq. before introdn. into, or in, the vessel, (c) passing O₂-contg. liq. through an ultraviolet light source and either (d) stripping O₃ from the liq. for use or (d') mixing liq. pregnant with O₃ with another liq. contg. chemicals reacting with O₃, and (e) recycling O₃-stripped liq. for multiple use.

A specific use comprises (i) dissolving contaminant gases of SO_2 and NO_x with retained O_2 , e.g. from stack gases, in the absorber liq., (ii) radiating the liq., oxidising dissolved O_2 to O_3 , which reacts with SO_2 and NO_x to produce SO_3 and NO_2 , (iii) mixing radiated liq. with water to react with dissolved SO_3 and NO_2 to form H_2SO_4 and HNO_3 , (iv) gravity sepg. the non-miscible acids and carrier liq., (v) salvaging or disposing of prod acid(s) and (vi) recycling the liq. carrier.

O_3 is produced in a compact, closed system and may be retained dissolved in liq. until required for use. In the specific embodiment, irradiation may produce the desired amt. O_3 only for reaction. O_3 is useful as a disinfectant and sterilant. 13.3.78 as 885956 (6pp91)

USRU ★ D22 05336C/03 ★ US 4182-716
5,6-dihydro-2-methyl-N-phenyl-1,4-oxathiin-3-carboxamide prepn. - from oxathiolane-acetamide deriv. by catalytically treating with hydrogen peroxide, adding quat. ammonium salt and heating
UNIROYAL LTD 05.09.78-CA-310616
C02 E13 (08.01.80) C07d-327/06

Prepn. of 5,6-dihydro-2-methyl-N-phenyl-1,4-oxathiin-3-carboxamide (I) involves treating 2-methyl-N-phenyl-1,3-oxathiolane-2-acetamide (II) with H_2O_2 in presence of a heavy metal cpd. as catalyst and in water opt. contg. (a) aromatic hydrocarbon of b.pt. $<145^\circ\text{C}$., (b) chlorinated hydrocarbon of b.pt. $<130^\circ\text{C}$. or (c) alkyl aliphatic-carboxylate. The mixt. is agitated at $0-25^\circ\text{C}$. to form the 3-oxide of (II).

The 3-oxide is then contacted with a catalytic amount of quat. ammonium salt under acidic conditions in a non-protic organic solvent as defined in (a)-(c). The mixt. is heated at $45-80^\circ\text{C}$. with removal of the water formed.

The process is simpler and more economic than prior processes, and ecological problems associated with the waste liquids in such processes are avoided. (I) is a known bactericide and fungicide. 8.11.78 as 958909 (8pp1248)

Detergent compsn. - contg. surfactant and particles of hard porous polyurethane foam to improve soil removal

TOHO CHEM IND LTD 27.05.78-JA-062862

A97 E17 (A25 E14) (05.12.79) C11d-03/37

A detergent compsn. contg. coarse particles of porous hard polyurethane resin and surface active agent as effective components is suitable to remove dirt from plastics, glass, tile, and painted surfaces caused by fats or oils. Porous hard polyurethane resin may be produced from scrapped heat-insulating material of porous hard polyurethane resin etc. which has been crushed to <10 mesh. As the surface active agent alkyl sulphate, alkylbenzene sulphonate, dialkylsuccinic acid sulphonate, sulphuric ester salt of aliphatic alcohol, polyoxyethylene alkyl ether can be used.

When an appropriate amt. of the detergent compsn. of this invention is applied to the soiled surface, the soil is first swelled by the effect of the surface active agent. Particles of the porous hard polyurethane resin scrapes off the soil mechanically, whereby the soil is adsorbed in the porous structure, thus preventing recontamination. It is preferred to finally wash with water. The soft polishing effect of polyurethane resin, prevents generation of scratches on the surface of plastics, glass, etc.

In an example, 250 kg of powdered hard polyurethane resin having 60-80 Shore hardness by a D type Shore hardness tester, and 0.02-0.05 bulk density is mixed with 290 kg Dodecylbenzene sulphonate (40 wt. % paste), 0.5 kg propyl p-oxybenzoate (antiseptics) 0.5 kg Chapping preventing agent ('Soipon SC(RTM)'), and 500 kg water. The mixture was stirred in a ribbon mixer for 20 min. to obtain the product of this invention. 27.5.78. as 062862 (2pp126)

HENK D25 76862V/44 = J7 9042-006
Solid pourable washing and cleaning agents - contg. mixed boron- or aluminium silicates as calcium binding cpd

HENKEL & CIE GMBH 25.09.73-OE-008237 (20.06.73-OE-005458) (12.12.79) *NL7403-383 +C11d-11

Solid pourable washing- and cleaning agents contg. a finely -divided water-insoluble material with a Ca-binding capacity of ≥ 50 mg CaO/g anhydrous active material, of general formula $(Cat_2/nO)_x \cdot Me_2O_3 \cdot (SiO_2)_y$ (in which Cat is a cation which can be exchanged for Ca, with a valency of n, x is 0.7-1.5, Me is B or Al, and y is 0.8-6, esp. 1.3-4) are made by mixing the wet components with at least part of the remaining components of the washing- and cleaning agent and forming the mixt. into a solid pourable product in the known way.

Preferred Ca-bonding materials are Al silicates of formula $0.7-1.1 Na_2O \cdot Al_2O_3 \cdot 1.3-3.3 SiO_2$ with a particle size of 10-0.01 μ . The silicates are used to replace condensed phosphates such as tripolyphosphates usually found in cleaning agents. The silicates are less harmful ecologically in waste waters. 20.6.74 as 070777 (clg. 20.6.73; 25.9.73-OE-005458, 008237) C11d-11/00 (12.12.79)

E34 (08.01.80) *CA1056-687 +C11d-07/56 C11d-11

Free flowing granular dishwasher detergent is mfd. in a single mixing vessel from components including hydrated Na tripolyphosphate (I), Na and/or K silicate (II) having a wt. ratio of SiO₂ to Na₂O or K₂O of 2.4-3.25:1, chlorinated trisodium phosphate (III) and nonionic surfactant (IV). Method comprises first mixing in the ventilated vessel a dry mixt. of 30-45 wt.% of (I) and 20-30 wt.% of (III), the ratio of the vol. of the dry mixt. to the vol. of the vessel being 1:25-1:8.

15-30 wt.% of an aq. soln. of (II) is sprayed at ambient temp. onto the dry mixt., while continuing mixing, to form an agglomerate during hydration of (I). 1.5-6 wt.% of (IV) is then sprayed onto the agglomerate at ambient temp., while continuing mixing. The agglomerate is then coated by spraying onto it a further 10-25 wt.% of aq. soln. of (II) at ambient temp. to make up a total of 25-40 wt.% of (II) used. The coated agglomerate is then discharged from the vessel while continuing mixing to ventilate it to the air in the vessel.

The ratio of vols. and the ventilation of the vessel keeps the mixt. at a temp. at which (II) is relatively stable to retain available chlorine in the agglomerate. The silicate coating inhibits chlorine loss from the detergent during prolonged storage. 17.4.78 as 897199 (7pp927)

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishes accepted West German specifications (DAS) from the unexamined applications (OLS) which are given the normal DT code. in the case of Japan J5 represents the unexamined applications, and J7 the examined of the present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
A+	Polymer Applns.	G	Printing, Coating, Photographic Chemistry
AE	Polymer & General Chemistry	H	Petroleum
B	Pharmaceuticals	J	Chemical Engineering
C	Agricultural Chemistry	K	Nucleonics, Explosives, Protection
D	Food, Disinfectants, Detergents	L	Refractories, Ceramics
E	General Chemistry	M	Metallurgy
E+	General Chemistry Applns.		

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

PATENTS ON MICROFILM

For a number of countries, we film every patent specification in numerical sequence using a flat bed camera at 24:1 reduction ratio. The 200 ft. polyester diazo negative 16mm reels are second generation from a negative silver master. They are despatched weekly by airmail, shortly after the specifications are published.

A list of the available films is shown below, giving number of reels per country per year, annual costs as from 1st January 1980, and the dates from which film is available. Backlog film can be made available at the same annual costs as for the current year.

Please address orders and enquiries to the PATENTS SUPPLY DIVISION.

This sheet may be used as an order form for both current and backlog orders.

PATENTS COPY SERVICE

The Patents Supply Division has been organised to give an extremely rapid turnaround at low prices. The schedule of prices and turnaround times, together with the methods of ordering and payment, is given below.

SCHEDULE OF PRICES AND TURNROUND TIMES AS FROM JANUARY 1980

COUNTRY	DELAY from receipt of order within:	COST inclusive of (airmail) postage	SURCHARGE if applicable	NOTES
BELGIUM EUROPE PCT	1 day	per page £0.11, \$0.29 or Y84	—	Photocopies
FRANCE	2 weeks	per patent £1.55, \$3.60 or Y950	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
GREAT BRITAIN	2 days	per patent £1.65, \$3.75 or Y1000	—	Printed copies
JAPAN	4 days	per patent £1.10 or \$2.55	—	Photocopies
NETHERLANDS	1 week	per patent £1.50, \$3.45 or Y860	1p, 2c or 8Y per page if more than 20 pages	Printed copies
SOUTH AFRICA	3 weeks	per page £0.27, \$0.60 or Y170	Minimum charge equivalent to 5 pages	Photocopies
UNITED STATES	4 days	per patent £1.45, \$2.75 or Y880	13p, 25c or 80Y per page if more than 15 pages	Photocopies
WEST GERMANY	2 weeks	per patent £1.70, \$4.00 or Y1,040	1p, 2c or 8Y per page if more than 20 pages	Printed copies. Delay reduced to 4 days for double the normal cost.
CANADA SWITZERLAND EAST GERMANY SOVIET UNION	4 days	per page £0.19, \$0.50 or Y120	Minimum charge equivalent to 5 pages	Photocopies
 Copies of specifications can now be supplied for Austria, Brazil, Denmark, Finland, Hungary, Israel, Italy, Norway, Rumania and Sweden. Prices comprise actual costs plus a nominal handling fee. 				

METHOD OF ORDERING

- (i) By books of standard order forms available upon request, or
- (ii) By letter or
- (iii) By telex, to cut postal delay. French and West German patents ordered by telex are processed as rush orders at double normal cost (see NOTES above) unless normal service requested.

METHOD OF PAYMENT

- (i) On receipt of bi-monthly invoices, or
- (ii) By charges against deposit accounts. Subscribers are encouraged in their own interest to open deposit accounts with us so as to avoid the need for frequent payments.

Please address orders and enquiries to the Patents Supply Division.

DERWENT PUBLICATIONS LTD. Rochdale House 128 Theobalds Road London WC1X 8RP England

Central Patents Index NEWSLETTER

1980 No. 5

12th March 1980

1980 CPI SUBSCRIBER MEETINGS

IT IS IMPERATIVE THAT ANY CPI SUBSCRIBER WHO WISHES TO ATTEND AND HAS NOT YET RETURNED HIS OR HER REGISTRATION FORM SHOULD DO SO WITHOUT DELAY

1. CALL FOR PAPERS

Papers by subscribers will again form an important part of the programme at the CPI Subscriber Meetings. In addition to topics related to the use and development of Derwent services, there are many areas such as developing technology and information analysis which would be of considerable relevance to delegates.

* 2. ROOM RATES AT NEW YORK HILTON CPI MEETINGS

Derwent has been informed that the range of room rates quoted by the New York Hilton for subscribers attending the New York CPI Meetings was not after all correct. The correct quotation is Single \$75, Double \$92.

3. ELECTRICAL PATENTS INDEX MEETINGS

Special one day meetings to explain and discuss EPI have been arranged as follows:-

Tokyo	-	Okura Hotel	-	March 13th.
London	-	Royal Garden Hotel	-	March 28th.
New York	-	New York Hilton	-	April 8th.

Meeting booklets have been circulated to all CPI subscribers. While EPI will be discussed to a limited extent at the forthcoming CPI Subscriber Meetings, it is recommended that Subscribers with a special interest in EPI should attend one of the full day meetings detailed above.

A LARGE NUMBER OF DELEGATES HAVE ALREADY REGISTERED AND SINCE PLACES ARE LIMITED YOU ARE URGED TO INFORM DERWENT IMMEDIATELY IF YOU WISH TO ATTEND AND HAVE NOT SO FAR INDICATED YOUR INTENTIONS.

Correspondence should be directed to Mike Pope who is coordinating the various technical and physical arrangements involved.

* 4. INSTRUCTION CLASSES

Centralised classes for online and general instruction and in-house visits are being scheduled currently and requestors will be informed of arrangements by letters to be sent during the week of 16th-21st March.

The finalised itinerary of central classes will be given in the next Newsletter.

* 5. CATCH-UP FOLLOWING CHRISTMAS/NEW YEAR DELAY

Inclusion of countries in Derwent services will be restored to schedule by the insertion of two issues of French patents in Week C08, an extra issue of Dutch patents spread over Weeks C09 and C10, and two issues of Canadian patents in Week C11.

* 6. BELGIAN PATENTS

Delays in receipt of Belgian patents from the Belgian Patent Office are continuing and inclusion of Belgian patents is consequently about one week behind schedule.

7. INTERNATIONAL PATENT CLASSIFICATION

The 1979 (Third) Edition of the IPC has now been published in English, French and German versions by Carl Heymans Verlag. It can be purchased from them as individual volumes 1-8 containing IPC Sections A-H and volume 9 which is a Guide, Survey of Classes and Summary of Main Groups or as a Complete Set Volumes 1-9. The cost of the complete set is DM 537 and the cost of the single volumes varies from DM 35 - DM 124. Volume 9 costs DM 40.

IPC³ is already being applied to PCT patents published from 1.11.79. It is expected that several other countries will use the new IPC starting in January 1980. Exceptions to this already known are Switzerland where the new IPC will be used from 1.4.80. and West Germany where it will be used completely from 1.7.80. but may be applied as a special service from 1.1.80.

* 8. U.S. OFFICE

Mr. Brian Lafferty, Assistant Manager, Subscription Department will be at our Washington Office from Monday 17th until Friday 28th March. Subscribers are reminded that the telephone number of our Washington Office is (703) 521-7977.

* 9. EPO COMPLETE SPECIFICATIONS MICROFILM

All subscribers to European Patents Complete Specifications on microfilm received with Advice Note No. 9 (5th March 1980) a detailed description of changes in format for this film. This instruction sheet will be vital to all users to ensure rapid location of items and further copies are available from our Microfilm Department upon request.

* 10. MANUAL CODE INDEXES IN THE BAJIS AND IN PROFILE 21

There have been extended problems with these indexes since Week C01. The Indexes for Week C01 and C02 will be bound into Week C04 products. If Weeks C03 and C04 indexes are available in time then one or both will also be included in Week C04 products.

Since loose sheets are never satisfactory, it has been decided to bind late indexes into following products, which leaves a Subscriber free to photocopy and mount any index into its corresponding book, if desirable.

* 11. MAGNETIC TAPE PRODUCTS

There has been a delay in the production of the weekly 'Single Tape Product' with the result that no tapes have yet been sent out with C-series data.

The software problems causing the delay have now been solved by our bureau and we will be supplying all the delayed data on a single tape, due for despatch next week.

This tape will contain Bibliographic and Manual Code data for Weeks C01-C05 and Multipunch data for Weeks B45-B48. This is the quickest way for us to make up the backlog, and we trust that it will not cause any complications.

Following this catch-up the weekly 'Single Tape Product' will be despatched regularly and each file on the tape should carry a single week's data.

A tape covering the same ranges of delayed data will be sent next week to subscribers to the monthly tapes.

* 12. WPI ONLINE FILE POSITION

<u>InfoLine</u>	<u>Loaded to</u>	<u>Awaiting Loading</u>
Basics/Equivalents	B51 (7912)	C01-C05
Manual Codes	B51	-
Multipunch A + PKT	B48	-
Multipunch BCE	B48	-
<u>SDC (USA)</u>		
Basics/Equivalents	B51 (7912)	C01-C05
Manual Codes	B51	-
Multipunch A + PRT	B44	B45-B48
Multipunch BCE	B44	B45-B48

* 13. EUROPEAN/PCT DESIGNATED STATES/CITATIONS

InfoLine has added the Designated States (qualifier DS), Citations (qualifier SR) and Language Indicator (qualifier LA) for European and PCT Patents to their Online file. These have, at present, been updated to Week B33 but will be updated to be in line with the Basic/Equivalent bibliographic details within the next two weeks.

14. SEARCHES FOR SUBSCRIBERS AND NON-SUBSCRIBERS

A very useful ancillary service is provided by the Technical Services Division in performing searches on demand for both subscribers and non-subscribers.

Searches are performed by experienced technical staff against Derwent's extensive database of some one and three quarter million patent families, using whatever access points or coding are the most appropriate. Such searches will be extremely valuable, but we must emphasise that from a legal standpoint they can in no way be construed as novelty searches and cannot replace these.

The prices quoted below are minimum prices per search request and estimates will always be given on request before proceeding or where the actual cost considerably exceeds these figures.

Type of Search	Cost:Subscriber		Cost:Non-Subscriber	
	£	\$	£	\$
Bibliographic (concordance)	14	30	18	40
Subject (incl. patentee)	25	55	35	78
Offline Prints/ Citation	0.065	0.13	0.12	0.25

Searches are carried out within 24 hours of receiving written instruction (letter or telex) provided no further query or clarification is involved.

Requests should be directed to Technical Services Division, Derwent Publications Ltd. at our London address.

KEMP/ ★ D11 05515C/04 ★BE-878-375
Two-speed mixing or kneading machine partic. for bakery - has programming keyboard for integrated circuit controller with input memory

KEMPER K 23.08.78-DT-836757
R53 (17.12.79) A21c B01f H02p

An electrically powered bowl mixer or kneading machine with two or more operating speeds is described. The machine is of the type in which the mixing bowl is covered with a safety grill. Opening the grill for access to the bowl automatically isolates the machine from the electric supply. A time switch can be set to operate the machine at selected speeds for selected durations.

The machine is now furnished with a keyboard operated electronic controller with input memory. A digital display indicates preset and actual durations of operation at each speed. If the high speed operation period is interrupted by safety grill removal, replacement of the grill is used to initiate a brief operation at low speed followed by return to high speed for the remainder only of the preset duration.

The mixer is programmable from a single, accessible keyboard without mechanical alterations to the machine. If stopped during higher speed period, it can pick up where it left off after an automatic, slow pickup. 22. 8. 79 as 878375 (18pp448).

ZUGM- D11 30858R/18 =DS 1944-863
Domestic oven protects controls from fume attack and - cuts in and out depending on control panel position

METALLWARENFAB ZUG (MET-) 15.10.68-CH-015425
+Q74 (17.01.80) *DT1944-863 +F24c-15

A baking oven, esp. one of the built-in flush fitting type, has a door which is hinged at the bottom and above the door a box contg. the control fittings and control knobs. This box is the enclosed front part of a drawer for a duct contg. a fan to discharge steam and vapour to the chimney. When the drawer is pulled out, an opening in its bottom with a filter lies above the door opening so that any vapours from the baking space are extracted instead of contaminating the controls. The drawer also uncovers holes from the space surrounding the baking space so that the oven can be cooled quickly if desired.

The kitchen is thus kept free from vapours and the controls are well protected. 4. 9. 69 as 944863 (4pp39).

PAUL/ D11 76232Y/43 =DS 2716-163
Continuous electric baking oven - with interlinked charging doors on inner and outer muffle shells for spiral chute

PAULUCCI J F 12.04.76-US-676211
+Q77 (17.01.80) *DT2716-163 A21b-01

An oven for the baking of food such as pizzas, has between the outer shell and the insulation of the inner shell a space through which cool air is circulated by a built-in fan. The electrically heated inner shell houses an inclined spiral chute along which the pizza in its baking tin can slide, controlled by a slowly revolving cage with vertical bars. A charging door on the inner shell can swing outward, as it is hinged and coupled by a rod to an outer sliding door, when the latter is raised. A boss on the inside of the inner door pushes the pizza off the charging table to the chute.

This keeps the outer door always cool and protects the operator from excessive heat. Frozen pizzas are prepd. and baked in $3\frac{1}{2}$ mins. 12.4.77 as 716163 (7pp39).

MART/ ★ D11 05945C/04 ★FR 2422-151
Weighting-out machine for dough - incorporates prepn. of dough and transport of dough to weighing device ensuring true weighing of portions directed to the conveyor band

MARTINEZ R 08.04.78-ES-469434
R13 (07.12.79) A21c-05 G01g-17/06

Weighing machine for dough comprises an open dough

prepn. chamber communicating through a lower coaxial hopper with a piston and cylinder system which receives a specific amt. of dough and delivers it to a conveyor band. The coaxial hopper can be closed cyclically by an element designed, on one hand, to close the inlet of the communication hopper so as to prevent the passage of dough and, on the other hand, to allow the passage of the paste for the delivery of the specified quantity when it is open.

Dough level detector allows the periods of stoppage and operation of the chamber to be determined. The chamber can rotate about its own axis and the assembly carrying the cylinder and piston can be displaced longitudinally by a system of guide and rollers under the action of a bolt and nut system driven by a motor.

Machine itself possesses directly the means of prepn. of the dough and of transporting it to the weighing-out device ensuring the true weighing out of the portions which are directed on to a transporter band. 29.1.79 as 002232 (7pp1192).

GEME- ★ D11 05989C/04 ★GB 2025-306
Folding food-crepe along diagonal by dropping into shaped casing - feeding fold between pinch rollers removing crepe from casing

ETAB GEN MEC OUEST 04.07.78-FR-019944
(23.01.80) A21c-09/08

A circular crepe is discharged from the end of a conveyor belt and falls into a shaped casing which causes the crepe to fold back on itself along a diagonal. The fold tilts sideways and enters the bight between a pair of rollers one of which is pref. the end roll of a second conveyor. The rollers press the fold and the conveyor removes the folded crepe.

Pref. the upper roller includes a peripheral bead which forms a radial score line in the crepe to define the location of a second fold. A pref. moistened crepe is discharged into a casing by a first conveyor belt. 26.6.79 as 022183 (7pp295).

MEIJ ★ D11 06731C/04 ★J7 9044-733
Instant bread mix - prepd. from flour sugar, oil, salt, yeast and yeast food by forming into dough, drying, grinding and mixing with baking powder

MEIJI SEIKA KAISHA 01.03.76-JA-021917
(27.12.79) A21d-10

Method comprises mixing flour, sugar, oil, salt, yeast and yeast food with water, fermenting the dough, drying the dough at a temp. below the alphasising temp. of starch (usually $<50^{\circ}\text{C}$), grinding the dried dough into powder, and mixing the powder with baking powder.

In use, the powder is mixed with water and baked. 1.3.76 as 021917 A21d-10/00 (27.12.79) MEIJI SEIKA KAISHA (5pp83) (J5 2105241)

FOOD= ★ D11 06867C/04 ★SU-661-251
Automatic controller of dough lump mass - has dough supply mechanism and rotating divider with piston and volume regulator

FOOD IND CORR INST 20.12.76-SU-432673
R13 (15.05.79) G01g-09

Automatic controller of dough lump weight has programmer connected through a comparator to an amplifier, providing signal to a regulator of a dough divider. Dough is supplied by motor driven screw feed to a pressure measuring section with tensometric gauges connected to multiplier of a controller.

Goroshenko, M.K., Zabolotskii, Yu.A., Kulakovskii, A. I. Bul. 17/5.5.79. 20.12.76. as 432673 (4pp23)

UPRO= ★ D11 06904C/04 ★SU-662-051
Dough dividing machine for bread-baking - has dough chamber with notched delivery rollers which move into the compression zone as the rollers revolve, to reduce pressure, etc.

UKR PROVISION EQUIP 29.06.73-SU-940477
(25.05.79) A21c-05/04

Dough-dividing machine is used in the baking industry. It comprises a receiving funnel, dough chamber with delivery rollers distributed inside it and rotating towards one another, dividing head, and drive motor. Mechanical influence on the dough is reduced, and the dividing accuracy is increased, by cutting notches on the working surface of at least one of the rollers. The notches are made segment-shaped.

Potassium bromate powder additive to flour and starch - contains phosphate salt and hydrated salt to reduce inflammability and explosion-hazard (NL 9.10.79)

PENNWALT CORP 05.04.78-US-893555

E34 (D17) (15.01.80) *DT2913-773 +A21d-10

Flour and dough improvement compsn. is prepd. comprising a powdery mixt. of potassium bromate plus 30-125 wt. pts. of an inert, edibly acceptable, flame retardant phosphate salt per 100 wt. pts. of bromate.

The compsn. further contains an inert, edibly acceptable hydrate salt which provides ≤ 50 wt. pts. of water per 100 wt. pts. of bromate. The hydrate salt is present in amt. sufficient to reduce the fire and/or explosion hazard of the compsn. when mixed with equal proportions of flour or starch.

Pref. the phosphate salt is also a hydrated salt and provides ≤ 50 wt. % of water per 100 wt. parts of bromate. The compsn. is esp. used in the milling and baking industry. 5.4.78 as 893555 (5pp931)

D12: MEAT; FISH PROCESSING

MEAT= D12 74440W/45 =DS 2516-995
Carcase skinning conveyors in meat prodn. line - having unhooking point of front legs dependent upon carcase length

MEAT IND RES INST 17.04.75-DT-516995 (17.04.74-SU-012229)
(17.01.80) *DT2516-995 A22b-05/16

A plant to skin animal carcasses in abattoirs, when suspended by the hind legs from rollers on a monorail, consists of an outer endless chain and an inner endless chain which move at different speeds. Hooks on the meat of the fore legs are engaged in cross bars of the outer chain and the skin at that end is moved into a hook on the inner chain.

The fore leg hooks on a skinned carcass are removed from the cross bars by two conical discs, with a one-sided slot and release stop between them. The rollers with the rear leg hook are stopped during this disengagement and are released by a rope pull so that the carcass can run clear on an inclined monorail section.

This mechanism disengages the hooks independent of the size of the carcass and prevents any contamination of the carcass. 17.4.75 as 516995 (11pp39).

MEAT= ★ D12 05678C/04 ★DT 2925-095
Flow line for sausage mfr. - with closed loop of stepping conveyors and roller tables for all prodn. stations

MEAT IND RES INST 21.06.78-SU-623634
(17.01.80) A22c-18

A flow line for the prodn. of sausage food is a closed loop, formed by two parallel step-by-step conveyors, with a step equal to the size of a mould. The line includes stations for the extrusion of sausage meat, filling/metering, treatment by heat and cold, mould discharging and mould rinsing. Inclined roller tables join the ends of the parallel conveyors.

This speeds up the mfr. of sausages and reduces the amt. of ancillary operations required. 21.6.79 as 925095 (57pp39)

BADI ★ D12 05731C/04 ★EP ---6-528
Polyamide used in forming meat and sausage casings - prepd. by condensing hexa:methylene di:amine and azelaic acid

BASF AG 22.06.78-DT-827384

A97 (A23) (09.01.80) A22c-13

D/S: E(BE, CH, DT, FR, GB, NL, OE, SW).

Polyamide 69 is used for the prodn. of casing tube for meat and sausage goods, and is partic. suitable for sausages which are boiled or scalded at 70-100°C as part of the manufacturing process.

The casing has high flexibility and strength. The sausages encased in the polyamide film have longer storage life than casings made of polyamide 12.

11.6.79. as 101895 (5pp004).

Animal brain sub:commissure-organ removal - includes specified skull and brain cutting, used in animal carcass processing
ROST MEDICAL INST (MEAT=) 09.12.77-SU-553079
(15.05.79) A22b-05 A61k-35/30

Animal brain subcommissural organ is removed from animal brain during animal carcass processing in meat industry by sectioning animal skull and sepg. the subcommissural part of the brain to remove the above organ.

The process is simplified and the removal of the organ is accelerated if the animal skull is cut with guillotine type cutter, asymmetrically at angle to sagittal line. The brain is then sectioned in the above region along the aqueduct of Sylvius and the subcommissural organ is removed by section of the lamina quadrigemina region and sepn. from the posterior cerebral commissure and of the brain.

Sizy yakina, L.P., Gulyants, E.S., Mamonov, N.D. et al. Bul. 18/15.5.79. 9.12.77. as 553079 (2pp938)

Severing oil bag from poultry carcass - held against rotating knife support bracket

GRAHAM K 20.03.78-US-890603
(15.01.80) A22c-21

Poultry carcasses are suspended from an overhead conveyor which carries them through a processing station. A bracket is attached to an auxilliary conveyor which is

synchronised with the main conveyor to bring the brace into contact with the tail of the carcass to support and orient it prior to cutting. A rotating knife engages the oil bag and pushes it against a stationary blade in a scissors action which removes the oil bag from the carcass.

The appts. removes the oil bag from a carcass with cutting away valuable meat. 20.3.78 as 890603 (9pp29)

Mfg. sausages in skins - by forming final casing thermo-seal and cooking over provisional seal to prevent filaments impairing seal
VINOKUR I 29.07.77-AR-268612

Q31 (15.01.80) B65b-07/02 B65b-09/12

Sausages are made by stuffing thermo-sealable tubular casing with meat emulsion, making a preliminary seal, at least partially cooking, then forming a final seal at the same site as but wider than the preliminary seal so that the meat is compressed into the casing.

For partial cooking, the sausages are pref. heated at 80°C for 2 min. before final sealing and cooking. The final sealing cuts meat filaments retained by the preliminary seal so that they do not interfere with the final seal and the seal remains intact. 20.7.78 as 926344 (3pp1358)

P13 (17.01.80) *NL7405-008 A23c-19/02

Cheese, cut into pieces for sale is prepd. from ultrafiltered milk contg. at most 18 wt. % fat free dry measure. Such milk, contg. rennet and seeded with suitable lactic acid bacteria, is warmed and poured, together with known additives, into at least one vertical standing vessel. There the milk is allowed to coagulate in a stationary state to a coherent mass. Then the coherent mass is pushed upwards by a uniformly distributed pressure applied to its underside.

As the mass protrudes from the vessel cutters at a previously determined height on the upper edge cut the mass into standard gel-segments. These gel-segments are cut into gel-cubes and dehydrated until up to 70 wt. % of their water has been lost. The cheese is then ripened in the usual manner. 11.4.74 as 462710 Div. ex 2417926 (4pp068).

Controlling atmos. of cold store for fruit and vegetables - with combined nitrogen generator and absorption unit for carbon dioxide (BR 27.11.79)

SAMIFI BABCOCK SPA 06.04.78-IT-022035

(07.12.79) A23b-07 A23n-15 C01b-13 C01b-21 C01b-31/20

Generator comprises a burner using a gas such as methane or propane so that the burner exhaust contains N_2 and CO_2 . The exhaust is passed through a water-cooled condenser which drains off sepd. moisture. The dried exhaust gas is directed through one or the other of two absorbers in parallel. Each absorber is charged with a substance, e.g. activated C, capable of absorbing CO_2 , so that N_2 alone is available for controlling an enclosed atmos. Cooling water is circulated in the burner casing.

Improvement is that burner casing comprises a cooling jacket in which each wall is a pair of plates narrowly spaced apart by intermediate, coincident bosses welded together. The narrow channel between the plates provides a passage for cooling water. The path of the water is determined to give uniform cooling over the whole of the wall.

Controlling the atmos. in cold stores etc. so that the proportions of N_2 , O_2 and CO_2 are best suited to extend store life of produce such as fruit and vegetables.

Uniform cooling of the burner casing reduces thermal stresses and eliminates breakages. The burner operates more smoothly and flame blow-back is eliminated.

30.3.79 as 008138(25pp448).

FROM ★ D13 05886C/04 ★FR 2421-561
Prepn. of alkali or alkaline earth metal caseinate(s) - soluble in acid medium, by strong alkali treatment of a clot obtd. by acid treatment of skimmed milk, followed by re-pptn. using acid

FROMAGERIES BEL-LA VACHE 06.04.78-FR-010298

(07.12.79) A23j-01/20

Prepn. of an alkali(ne earth) metal casein salt is claimed in which skimmed milk is acidified by natural or by acid means to about the isoelectric point (pH4.6 at 20°C), the lactoserum is drained or filtered off, the clot is washed with slightly acid warm water opt. followed by draining and drying, and then the prod. is solubilised by an alkaline soln. at about neutral pH to form the caseinate..

Before the solubilisation, the clot is first solubilised in a strongly base bath (pH10-12) constituted by an alkali(ne earth) metal base at ordinary temp. for 30 mins to several hours, or at up to 80°C for 30 min. to 3hrs. and a pH > 10 ; followed by reprecipitation of the casein at about the isoelectric point using acid, sepn. and washing with acidified water (pH 4.5).

The process enables caseinates of improved solubility, partic. in acid medium (e.g. up to pH 5.2), thereby enabling a wider application of the caseinate in food preps. 6.4.78 as 010298(9pp597).

Hard wood smoke condensate treatment - includes fractionation, adsorption, desorption and steam distillation, for use in food curing
MEAT IND RES INST 27.03.65-SU-949764
(03.07.79) A23b-04/04

Liquid used in curing processes is prep'd. by distilling the condensate of the smoke of hard wood; adsorbing the smoking components from the distillate, and sepg. them by desorption. This process is improved by distilling the smoke condensate in two fractions; sepg. the smoking components from the first fraction by adsorption and subsequent desorption, and combining the smoking components from the first fraction with unprocessed second fraction. By this method the smoke condensate is utilised to increased degree and harmful impurities are largely eliminated.

marshmallow sweets forming appts. - has opposed belt pairs twisting from horizontal to vertical to join halves without deformation

KHLOPOV LV 17.06.76-SU-373278
(20.05.79) A23g-03

The installation comprises boards carrying rows, each of six half sweets, to an inclined conveyor section leading to a horizontal section from which the halves are picked up by paired flexible belts with guide and pressure rollers. Each belt twists about a horizontal axis in one section and about a vertical axis in another, so that belt working surfaces move from a horizontal to a mutually facing vertical position.

As the belts move from the horizontal they contact the outside of the halves to bring their flat sides together to contact each other, finally delivering them to a discharge conveyor after joining.

Such arrangement improves reliability and accuracy and does not deform the halves.

Khlopov, L.V., Gvozdk, I.A., Shchekina, A.A. et al. Bul. 18/15.5.79. 17.6.76. as 373278 (3pp1358)

Apparatus for producing dried fruit products - with predetermined moisture content, by moisturising beyond desired value followed by drying

TREE TOP INC 12.10.77-US-841298
(15.01.80) A23b-07/06 A23i-03/18

The system comprises a moisturising appts. for increasing the moisture content of the fruit above the target value. The moisture content of the fruit is measured as it leaves the moisturising appts. and this measurement is used to alter the amt. of moisture being introduced into the appts.

The fruit is fed to a drier where the moisture content of the fruit is reduced to the target value. The moisture content of the fruit leaving the drier is measured and this value is used to alter the temperature of air introduced in to the drier.

If desired sulphur dioxide may be introduced simultaneously with the moisture to penetrate the fruit prod. The moisture content of the fruit pieces is controlled to give a uniform product in a relatively short time. 12.10.77 as 841298 (9pp295)

Fruit juice extractor - has scraper travelling over ports in wall of centrifugal drum cup section

MATSUSHITA ELEC IND KK 22.12.76-JA-155359
P28 (15.01.80) *DT2757-390 A23n-01/02

A juice extractor for adjusting the pulp content in pulp has a frusto-conical filter basket which is rotated at high speed, and a pot connected to the bottom of the basket which has perforations in the side wall and an adjustable scraper to remove pulp containing juice from the outer wall of the pot.

The scraper can be moved from one position in which the pulp removed from the wall to another in which the scraper is sufficiently spread from the wall not to contact the pulp.

The pulp passing through the perforators is recycled. 21.11.77 as 853831 (8pp1376)

AIRP ★ D13 07172C/04 ★US 4183-384
Fluid blending control appts. - for maintaining concn. of one fluid being blended below a max. value

AIR PRODUCTS & CHEM INC 18.01.78-US-870553
J02 Q39 + Q31 (15.01.80) B65b-03/04 B67d-05/56

The appts. ensures that in a fluid blending process the concn. of the fluid is maintained below a defined max. concn. The appts. comprises a single valve located in the inlet line of the fluid to be controlled and sensors for sensing the flow rate of each fluid stream being supplied to form the blend. The valve interrupts the flow of the fluid to be controlled if the flow rate of that fluid stream increases or if the flow rate of any other fluid stream decreases.

Used in blending CO with N₂ to form a medium for preserving foodstuffs. The control appts. ensures that the CO content is maintained at a level below that at which the CO could form an explosive mixt. with air. 18.1.78 as 870553 (6pp67)

Soln. preventing rot or mildew on seeds, silage and other feed comprising water, ammonium isobutyrate and free isobutyric acid and having neutral pH

GRACE W R CO 22.03.78-US-889010 (07.11.72-US-304462)
C03 (15.01.80) A01n-09/02

A soln. useful for preventing rot and mildew from forming on feedstuff, including seeds, consists of water, ammonium isobutyrate and isobutyric acid, such that the "nominal" NH₄ isobutyrate content is 54-62% and the "actual" isobutyric acid content is 2.5-8%. The soln. has a crystallisation temp. of -20 to -40°F and a pH of 6.8-7.2.

The "actual" isobutyric acid content is the amt. of Me₂CHCOOH present in the soln.; whereas the "nominal" NH₄ isobutyrate content is the actual NH₄ isobutyrate present in the soln. plus the amt. that would be formed if the actual isobutyric acid in the soln. were converted to NH₄ isobutyrate; i.e. "nominal" percent NH₄ isobutyrate plus percent water = 100%.

The compsn. prevents rot caused by bacteria and/or mould in stored silage. It can be used without introducing too much water into the treated feedstuff and also without causing corrosivity problems. It can be stored and transported. 22.3.78 as 889010 C.i.p. 3786086, 3899588 (+17.10.73, 15.5.75, 17.7.76-US-407106, 577890, 709118 (11pp914))

Free-running material fluidity measurement - by inverted angles
splitting descending flow into primary and second arm streams and
comparing
MAGGI AG 09.08.76-FR-024334
J04 R16 (17.01.80) *DT2732-130 G01n-11/04

A device to check the fluidity of free-running bulk mater-
ials consists of a rectangular funnel with two complement-
ary adjustable halves so that the discharge gap can be var-
ied. Below the gap, a first central dihedron is followed at
a lower level by two dihedrons, one at each side. Three
containers are placed to catch the three streams of mat-
erial formed thereby. The proportion of it dropping in the
central to that in the outer containers gives a clear indic-
ation of the fluidity.

This creates a very simple and very accurate method
of checking the fluidity of any free-running or even fluid
media. 15.7.77 as 732130 (8pp39).

BONN/ ★ D14 05888C/04 ★FR 2421-568
Centrifugal dryer for washed vegetables before packaging - has
rotor with pivoted holders for baskets loaded with wet vegetables
BONNET R 06.04.78-FR-010182
P41 (07.12.79) A23n-13 B04b-05/12

Machine comprises a floor-mounted, vertical cylindrical
casing contg. a high speed rotor fixed to a power-driven,
vertical shaft. The rotor is equipped with pivoting basket
holders. The top of the casing has a circular cover of
which one half can be opened by swinging upwards on a
diametral hinge.

Pref., the stationary rotor suspends the basket holders
so that basket axes are parallel to the vertical rotor shaft.
At full speed rotating of the rotor, centrifugal force pivots
the holders so that basket axes are at 90° to the shaft

axis. Centrifugal force alone is used to thrust the basket into its holder, so no clamp or basket cover is required. The opening half of the casing cover pref. has a safety switch which prevents drive to the rotor if the casing half is not closed.

Used for drying washed vegetables ready for distribution in boxes etc., partic. leafy vegetables such as cabbage, spinach, endives, leeks, chicory, turnips, carrots, potatoes as well as fruits. Labour costs are reduced by mechanisation. Further savings are achieved by eliminating the use of contact drying materials such as tissues, wiping cloths, etc. Water extracted from the prod. can be drained from the casing for recycling. 6.4.78 as 010182 (9pp448).

Removal of poly:nitrophenol contaminants from water - by treating with chlorine dioxide
COSDEN TECHN INC 21.08.78-US-935148
A41 E14 H05 (17.12.79) C02c C07c

Removal of nitrophenol contaminants from aq. streams is effected by adding ClO_2 in an amt. sufficient to degrade the contaminants, which are of formula (I)

The process is useful for treating (I) waste waters from the petrochemical industry esp. from the mfr. of vinylaromatic cpds., in which cpds. (I) are used as polymerisation inhibitors. The treatment effectively removes di- and trinitrophenols, esp. 2,6-dinitro-p-cresol (DNPC), which cannot be removed by alkali/ Cl_2 treatment. 21.8.79 as 878335 (12pp367).

BOV ★ D15 05502C/04 ★BE-878-346
Electro-flotation appts. to purify polluted effluent - has self cleaning cathodes arranged as a pair alternately actuated for each anode
BBC BROWN BOVERI SA 23.08.78-CH-008913
P41 (17.12.79) B03d C02b C02c

Two cathodes are fitted in relationship to each anode. All the electrodes are pref. cylindrical rods, the cathodes being arranged as one grill of parallel rods and the anodes as another grill. Alternate cathodes are connected to two separate electric supply conductors. The anodes are pref. made of titanium or stainless steel and are coated with lead dioxide. The combined surface area of the anodes should be at least equal to, more partic. twice as great as, the total surface area of the cathodes.

One cathode conductor is held at negative potential while the other is retained at zero potential. Connections to these two conductors are periodically reversed. Conductor reversal can be automatically effected by a time switch, by voltage rise in a constant current system or by current drop in a fixed voltage system.

Used in electroflotation to purify polluted effluent. Deposit on one set of coupled cathodes is dissolved away whilst that set is at zero potential. Periodic reversal of cathode connections makes the cathodes self cleaning. No need to empty the cell or remove the cathodes for cleaning. 21.8.79 as 878346 (8pp448).

CANA ★ D15 05522C/04 ★CA 1068-856
Casting tubular membranes - in a casting tube using a casting bob having a casting slot of variable size
NAT RES COUNCIL CAN 29.04.77-CA-277416
A88 J01 (01.01.80) B29d-23/08

Appts. for casting tubular membranes, for use, e.g. in ultrafiltration and reverse osmosis, includes vertical casting tubes and a casting bob assembly movable through each tube. The bob assembly includes means to supply casting soln. to the assembly and means to introduce gas into each tube below the assembly.

The bob assembly comprises a casting bob having an axial soln. feed channel leading to an annular channel and is screwed into a centering sleeve to a greater or lesser degree to alter the casting slot formed by the annular channel and the lower end of the sleeve. Associated with the casting bob assembly is a transport sleeve which can be moved into engagement with the casting bob to close the casting slot.

The centering sleeve accurately centres the bob during casting and screwing the bob into and out of the sleeve facilitates easy adjustment of the casting slot. Also the transport sleeves enable quick change over from casting tube to casting tube. 29.4.77 as 277416 (25pp525)

HOOK D15 63712Z/00 =DS 1900-998
Continuous production of chlorine dioxide - from alkali metal chlorate, alkali metal chloride and sulphuric acid in the presence of vanadium pentoxide catalyst
HOOKER CHEM & PLAST 05.03.68-US-710648
E36 F09 (17.01.80) *BE-729-357 C01b-11/02

Chlorine dioxide and Cl_2 are prepd. together with an alkali metal salt from a mixt. of an alkali metal chlorate, alkali metal chloride and a strong acid in proportion such that chlorine dioxide and Cl_2 are formed. The reaction mixt. is fed into a reactor maintained at -25° to 105°C (65 - 85°C) and under the temp. at which decompsn. of chlorine dioxide occurs. A catalyst from the gp. vanadium pentoxide, Ag ions, Mn ions, dichromate ions and As ions is present.

Reaction mixt. is subjected to a vacuum of 100-400 (150-250)mmHg to evaporate off water, chlorine dioxide and chlorine and a mixt. of water vapour, chlorine dioxide and Cl_2 and the crystallised alkali metal salt of the strong acid are removed from the reactor. During reaction the acidity of the mixt. is maintained at 7.5-6 (3-4)N by addn. of the strong acid and by evapn. of water. 9.1.69 as 900998 (6pp068).

Storm sewage tank - of circular shape with steeply inclined bottom and tangential inflow with inward offset
WEBER W 09.12.74-DT-458157
+Q42 (17.01.80) *DT2458-157 C02c-01/26 +E03f-05/10

A rainfall collection basin for municipal sewage plant has a circular shape and a conical bottom with an inclination of $\geq 25(45)^\circ$. The sewage, augmented by rainfall, enters tangentially at the conical bottom at two-thirds of the basin radius. A sludge pit is arranged at the centre, the sludge is carried away by a rising discharge pipe, starting at the pit. Clear water leaves the basin through an overflow weir.

This ensures a self-cleaning action for the sludge even for greatlt fluctuating inflow and fluid level conditions. The basin can also be utilised as a mechanical settling tank. 9.12.74 as 458157 (3pp39).

ALME- D15 11547X/07 =DS 2531-589
Rotary furnace for drying waste sludges - which tend to stick to the wall of the rotating drum
ALMER SANGYO KAISHA 15.07.74-JA-080907
J09 Q76 +Q77 (17.01.80) *DT2531-589 F26b-11/06

A horizontal rotary kiln for drying sewage sludge prior to combustion is fitted on its wall with L-shaped strips to lift up the charge, with the free ends pointing in the direction of rotation. Short chains with a ball at the end are suspended from the free ends; they are long enough to slide along the faces of adjoining strips without being caught by it. The chains are Al-coated. Two chain curtains, suspended from the wall without strips, divide the kiln into three compartments.

This kiln can deal with very adhesive sludge, partic. if preceded by a conical charging section. The kiln has a compact design and creates a min. of noise. 15.7.75 as 531589 (9pp39).

Aerobic compost fermentation from organic sludge - by traversing stirrer mechanism and top layer skimming conveyors in aeration tank

NIIGATA ENG KK (SEIB) 13.08.75-JA-098239
(17.01.80) *DT2636-535 +C05f-07

An open rectangular fermentation tank for the aerobic conversion of organic waste into compost has rails on its rim on which two straddling frames are slowly moved by gear motors. The first supports a carriage with two driven stirring shafts with outer spirals which is slowly reciprocated crossways by another gear motor. The second, also driven by a gear motor, supports a cross belt conveyor on which the finished compost is transferred by two opposite-hand worm conveyors on a hinged structure

which charge two parallel contrarotating transfer worm conveyors. The air is introduced at the bottom by a perforated plate or by parallel perforated tubes.

This fermentation system has a very high efficiency. Satisfactory aerobic fermentation is achieved even when the layer of refuse is high. 13.8.76 as 636535 (10pp39).

Extracting methane gas by anaerobic digestion of e.g. livestock waste - using air-tight digestion vessel having sub atmospheric pressure in space above waste

GRAHAM-SNIDER ENERG 02.06.78-US-912103

C04 E17 H06 (23.01.80) C01c-01 C12p-03 C12p-05/02

D/S: E(BE, CH, DT, FR, GB, NL).

In the extraction of CH₄ gas from carbon cpd.-bearing material by anaerobic bacteria digestion of the material, the improvement is that the digestion is carried out in an air-tight container into which the material is partially filled, and the space in the container above the surface of the material is maintained at a pressure less than atmospheric while digestion proceeds.

The process is esp. for treating livestock waste slurry material.

The sub-atmos. pressure above the waste material stimulates bacterial action by drawing the gas out of the slurry as it is generated, ensuring constant anaerobic fermentation and accelerated decomposition of the raw waste.

 Injecting gas into liq. esp. oxygen into waste water - with rapid response to peak loads of BOD
 CARBOXYQUE FRANCAIS 10.01.78-FR-000550
 (07.12.79) B01f-03/04 B01f-13/02 C02c-01/06
 Bubbles of the gas are injected into a moving, agitated interface of the liq. flowing across injection holes. In order to enter the injection zone the liq. is temporarily pressurised slightly and formed into a branch current which is diverted from and subsequently returned to the main body of the liq.. The main body of the liq. remains at a lower pressure and less charged with gas than liq. at the discharge end of the branch current.

Appts. pref. comprises a tank contg. waste water which is impelled up a submerged, vertical chimney into which a coaxial, perforated pipe injects oxygen. The branch current in the annular passage between chimney and pipe is slightly pressurised by the impeller. Impeller speed and rate of gas injection are pref. adjusted automatically in response to continuous monitoring of gas content of liq. in the main body surrounding the chimney.

Used for injecting gas into liq., partic. pure O₂ into waste water being purified by activated sludge. Liq. leaving the branch current is released into a lower pressure zone so gas retention is improved. Using pure O₂ instead of atmos. air reduces energy required for dissolving by 70% and raises the plant output by 30%. Great flexibility in handling peak loads is achieved. 10.1.78 as 000550(15pp).

Treating waste water from thermal decomposition of waste - by centrifugation and recycling recovered oils and solids for use as a fuel in thermal treatment

AGENCY OF IND SCI TECH 31.05.78-JA-064301

(10.12.79) C02c-05 C10b-49 C10l-01

Waste water from the thermal decomposition of e.g. municipal domestic wastes and industrial wastes etc., is treated by (i) removing oil components by flotation and solid components by centrifugation and (ii) recirculating them in slurry form for use as a heat source to the heat decomposing step.

The effective utilisation of the oil and solid components becomes possible and the waste water is effectively treated in the subsequent procedures without any disadvantages.

The recovered oil component has a calorific value of about 8,000-9,000 Kcal/Kg., and the recovered solid component has a calorific value of about 3,000-4,000 Kcal/Kg. 31.5.78 as 064301 (4pp34).

Waste water treatment - using recycled oils and combustible gases as a fuel

AGENCY OF IND SCI TECH 31.05.78-JA-064302

(10.12.79) C02c-05 C10b-49 C10l-01

Waste water from the thermal decomposition of e.g. municipal domestic wastes and industrial wastes etc. is treated by (i) contacting it countercurrently with air and steam to strip-off volatiles, e.g. lower boiling oil components etc. and (ii) introducing the volatilised components into a condenser in which they are cooled, condensed and sepd. into scum (oil component), condensed water and an uncondensed gaseous component.

The uncondensed component is then burnt and made harmless. The scum and the uncondensed gaseous component are used as a source of heat in the thermal decomposition.

The steam used in the stripping treatment is generated with surplus heat from the combustion furnace. By this process, about 80% of cyanide and about 50% of the COD components are removed in a short period. The amt. of NaClO etc. to be used for oxidative decompsn. of cyanides etc. in the subsequent procedure is greatly reduced. 31.5.78 as 064302 (4pp34).

KANE ★ D15 06387C/04 ★ J5 4156-344
Treatment of polyvinyl alcohol-contg. waste liquor - with titanium cpds., aldehyde(s) and acids, followed by biological treatment
KANEBO KK 30.05.78-JA-065378
A35 (A14) (10.12.79) C02c-05/02

PVA-contg. waste liquors are purified by solidifying the PVA for solid/liquid sepn., and then subjecting it to biological treatment. Ti cpd(s) are added so that the PVA is easily and effectively pptd. and removed by conventional solid/liquid sepg. means, e.g. filtration or centrifuging etc., so that the COD due to the PVA becomes almost zero.

Ti cpd(s) are e.g. titanitic acid, oxyacid salts of Ti, Ti malides or esters of titanitic acid etc. They are used at 0.3-10 pts. wt. per pt. wt. COD components in the waste liquor to react with them at 30-100°C. PVA pptn. is further accelerated by using the Ti cpd(s). in combination with an aldehyde, e.g. formaldehyde, glyoxal, malonic aldehyde etc.

The pptn. reaction proceeds more smoothly under acidic conditions with H₂SO₄, HCl, HNO₃ and acetic acid etc. The amts. of Ti cpd., aldehyde and acid to be added vary with the PVA content of the liquor, but are at approx. 0.3-10, 0.9-10 and 0.1-5 times the COD components concn. resp. 30.5.78 as 065378 (4pp34).

Continuous neutralisation of regenerated waste soln. - from continuous mixed bed pure water mfr. appts.
JAPAN ORGANO KK 02.06.78-JA-065793
(12.12.79) C02b-01/30 C02c-05/02

Continuous neutralisation of regenerated waste soln. from continuous mixed-bed pure water mfr. appts. (I) comprises mixing acid waste soln. and alkali waste soln. discharged from (I) to neutralise them. Acid waste soln. is introduced into a mixing-neutralising tank through a pipe connecting the acid waste soln. receiving tank with the mixing-neutralising tank, and alkali waste soln. is introduced into the mixing-neutralising tank through a pipe connecting an alkali waste soln. receiving tank with the mixing-neutralising tank, and when necessary, adding acid further needed for neutralisation to the pipe, and both waste solns. are mixed with air to neutralise with discharging CO₂ gas evolved.

The process of the present invention makes possible to neutralise waste soln. with a very small amount of acid, without causing SS in neutralised water. Apparatus is simple, and it can be continuously operated, therefore running cost and initial cost may be reduced. 2.6.78 as 065793 (7pp96).

Mechanism for flotation cleaning of fluid - has cylindro-conical baffle and plate on evolvent between baffle and body

FERR METAL EFFL PURIF 26.07.77-SU-512998

J01 P41 (28.07.79) B03d-01/14 C02c-05

The mechanism is for the removal of impurities which float up and settle down. It comprises a cylindrical body, inlet and outlet for dirty and clean water, outlet for floating impurities, and attachment for removal of the settling impurities. In order to create counterflow motion of the fluid and air, it has a cylindro-conical baffle set coaxially within the body. The fluid inlet is in the top of the body. There is a plate set on the evolvent between the baffle and the body, and a funnel is telescopically connected to the clean fluid outlet.

In the cylindrical body, the fluid rotates and moves down, and the dissolved air is separated out in the form of tiny bubbles, and floats up against the flow of the water. On meeting oil and other hydrophobic particles, the air sticks to them and floats them to the surface.

Mixing and preheating unit - has hydraulic lock with perforated upper horizontal sheet to increase passage cross/section

URAL THERMOTECH RES 28.01.77-SU-449006

J04 Q78 (15.05.79) C02b-01/10 F28c-03/06

The unit claimed in Parent Patent 399706, can be used as deaeration column, and contains a water distributor, a drainage arrangement made as a hydraulic lock and one or several bubbling plates. The plate is provided with a bypass arrangement. The bypass arrangement is made as a hydraulic lock submerged in water at low loads. The hydraulic lock outlet cross section is partially or completely covered with a perforated baffle. The perforated section slopes in the water flow direction.

To increase the efficiency by increasing the hydraulic lock passage cross-section, the hydraulic lock upper horizontal sheet is perforated. The perforated sheet allows the plate width to be reduced thus increasing the hydraulic lock passage cross section. The passage of additional amount of vapour through perforated sheet and through the hydraulic lock ensures a nominal pressure drop on the bubbling plate thus increasing the efficiency.

(15.01.80) C02c-01/06

The Known activated sludge waste H_2O treatment process for removing phosphate (I) from BOD-contg. H_2O in which (i) (I)-contg. influent H_2O is mixed with activated sludge and an O_2 -contg. gas in an aeration zone to reduce the BOD content and cause the activated sludge bacteria to take up (I) to form oxygenated phosphate-enriched mixed liquor (II); (ii) (II) is then discharged from the aeration zone and passed to a sepn. zone for concn. of solids to provide a (I)-depleted effluent and (I)-enriched sludge (III); and (iii) at least part of (III) is passed to an anoxic zone to resolubilise (I) from it to form solubilised (I)-contg. sludge is modified.

The improvement is that (a) at least a major part of the solubilised (I)-contg. sludge (III) is returned directly to the aeration zone as part of the activated sludge without intervening addn. of a (I) precipitant (for (I) removal) to biologically remove (I) from the BOD-contg. influent H_2O ; (b) the average food/biomass ratio of (II) in the aeration zone during the mixing in (i) is kept so that the product of the food/biomass ratio (in lb. $\text{BOD}_5/\text{day} \times \text{lb.}$ of volatile suspended solids) and the influent H_2O food/influent P ratio (in lb. $\text{BOD}_5/\text{lb.}$ of P) is ≤ 10 ; (c) (I) is removed from the process solely by wasting from at least one of the above sludges.

The process using the anoxic zone is less complex, uses less equipment, requires less power, and eliminates the need for chemical treatments to remove (I). The method removes $\leq 85\%$ pref. $\leq 90\%$ of total P introduced in the H_2O influent. 23.11.77 as 854320 (10pp438)

Beer clarifier comprising gelatin or fish glue - fixed on a carrier by adsorption or crosslinking

WILZ-PAULS R M 24.08.78-OE-006189
(17.12.79) C12h

The clarifier is fixed on a carrier so as to be insoluble in the beer. A particular embodiment comprises a fine powder mixt. of gelatin or fish glue with a known adsorption agent ensuring stabilisation of the proteins on which the gelatin or fish glue is fixed.

The clarifier is prepd. by contacting a soln. of gelatin or fish glue with a suspension of an adsorption agent stabilising proteins. The mixt. is left in contact for some time with occasional agitation. Alternatively a suspension is formed of the dry ground ingredients; or the protein is incorporated in the mfr. of the adsorption agent.

The clarifier accelerates the natural clarification of the beer, improves its filterability, has an adsorbing effect and does not affect the taste or smell of the beer. 23.8.79 as 878391 (19pp597).

Glucosamine derivs. - useful as antimicrobials and plant growth regulators

FUJISAWA PHARM KK 24.05.78-JA-062704
B03 C02 (06.12.79) A61k-31/70 C07h-05/06

Glucosamine derivs. of formula (I), are new (where R¹ = OH or imino; R² = amino or a bond when R¹ = OH, R² = amino; when R¹ = imino, R² is a bond, and R¹ is linked with R²).

(I)

(I) are produced, e.g. by a strain of *Streptomyces aburaviensis* subspecies *rufus* No.

4 (FERM-P 4296), which may be cultured on a medium contg. e.g. soluble starch (10 g/l), gluten meal (6 g/l), yeast (1.2 g/l) and CaCO₃ (1.0 g/l) (total 170 l), at 30°C for 3 days. A chemical route to (I) is also described.

Typically, N-carbamoyl-α-D-glucosamine and N-carbamoyl-β-D-glucosamine show MIC of 12.5 μ/ml (agar dilution) against *Proteus vulgaris* IAM-1025. Acute toxicity of (I) in mice (i.v.) is > 14 g/kg. 24.5.78 as 062704 (7pp52).

Enzymatic fractional determ. of water-soluble aldehyde(s) - involves addn. of alcohol dehydrogenase to reaction soln., for rapid, sensitive assay

TOYOTA CENT RES & DEV 29.05.78-JA-064802
E19 J04 R16 (08.12.79) G01n-33

The method comprises (a) adding 0.1-10 units of alcohol dehydrogenase to about 2 ml. of a reaction soln., or adding aldehyde dehydrogenase to a reaction soln., to treat water-soluble aldehydes other than formaldehyde with nicotinamide adenine dinucleotide (NADN), and determining water-soluble aldehydes other than formaldehyde by the change in the amt. of reduced NADN, and (b) adding 100-1000 units of alcohol dehydrogenase to about 2 ml. of reaction soln. to treat all water-soluble aldehydes with NADN, and determining all water-soluble aldehydes from the decrease of reduced type NADN. The water-soluble aldehydes and NADN are treated with alcohol dehydrogenase or aldehyde dehydrogenase in aq. medium, and the change in the amt. of reduced type NADN is determined by the measurement of absorbance.

Water-soluble aldehydes can be fractionally and rapidly determined with high sensitivity without being affected by interfering substances. Automatic analysis can be carried out by the method, and secondary environmental pollution is not caused by the reagents used. 29.5.78 as 064802 (5pp50).

Selective adsorbent comprising fixed sheep erythrocyte membrane which does not adsorb lymphocyte B alone of human leukocyte fraction

ASAHI CHEMICAL IND KK 30.05.78-JA-063874
A97 B04 P31 R16 (08.12.79) A61b-10 B01d-15 G01n-33/16
selective distinctive cell adsorbent which comprises fixing erythrocyte membrane of sheep or protein obtained from the erythrocyte membrane onto an insoluble carrier to form a selective adsorbent which does not adsorb lymphocyte B alone of human leukocyte fractions.

Method for selectively obtaining lymphocyte B floating in aq. which comprises contacting human leukocyte floating in aq. with the selective adsorbent. A separator for lymphocyte B is obtd. by filling the adsorbent into a column having an inlet and an outlet.

Insoluble carrier is e.g. agarose derivative, dextran derivative, cellulose derivative, polyacrylamide derivative, etc.

According to the use of the column filled with the selective adsorbent, lymphocyte T, monocyte and granulocyte in human leukocyte fractions are adsorbed on the adsor-

bent, and lymphocyte B alone can be recovered and identified. 30.5.78 as 063874 (5pp50).

Antibiotic A-10947 used as growth accelerator for animals - obtd. by culturing *Actinoplanes* microorganism in medium contg. carbon source, nitrogen source, etc.

TOYO JOZO KK 30.05.78-JA-065225
B04 (12.12.79) A23k-01/17 A61k-35/74 C07g-11 C12d-09/14

Novel antibiotic A 10947 and its salts, are new. It has a molecular weight of 1272 (by titration) and an analysis of C, 48.54%; H, 4.37%; N, 10.08%; S, 9.64%. It has a pKa of 7.4 (in 80% aq. DMF soln.) and specific rotation, (α)_D²⁵ = +64.1° (C=0.66%, CHCl₃). Antibiotic has specific UV, IR and NMR spectra.

It is positive to KMnO₄ decolouration; negative to Fehling's reaction, Mohrlich reaction, ferric chloride reaction, Ninhydrin reaction, biuret reaction and Dragendorff reaction, and is soluble in acetic acid, DMSO, pyridine, chloroform and methanol; insol. in benzene, n-hexane, CCl₄, petroleum ether and water. Its m. pt. is 205-220°C (brown discolouration-decomposition) and is white-pale yellow.

Antibiotic A 10947 is prepd. by inoculating antibiotic A 10947-producing fungi into culture medium contg. assimilating carbon source, nitrogen source and inorganic substance to culture, and removing antibiotic A 10947 from the culture substance. Fungi is esp. of *Actinoplanes* genus. 30.5.78 as 065225 (10pp69).

Biochemical reaction with magnetisable active component carrier - with polymer coating for attaching to active component
NATIONAL RES DEV CORP 27.08.71-GB-040297
J04 (20.12.79) *J48033-088 + C12d-13

The reaction is performed by catalysing the reaction medium with the biologically active organic substance adhering to a strongly magnetic solid carrier. Method comprises magnetising the carrier to separate the biologically active organic substance from the medium.

The active substances are various enzymes (protease, dehydrogenase, oxidase, amidase, kinase, etc.), enzymatic cofactors (NAD, ATP, riboflavin, coenzyme A, etc), organophosphorus cpds. antigens or antibodies. Magnetic carrier is Fe, Co, Ni and their oxides, alloys or various ferrites (e.g. Sr ferrite). The carrier is used as particles pref. of size 10-100 μ .

Pref. the biologically active substance chemically adheres to an organic polymer (e.g. nylon, polyurethanes, cellulose derivs., etc.) coating the magnetic carrier. In a batch method the medium can be removed while the carrier is maintained in a magnetic field after the catalytic reaction. In a continuous process, the carrier can be fixed in a reactor held in a magnetic field, through which the medium is passed. 21.8.72 as 083565 (clg. 27.8.71-GB-040297) C12d-13/00, 13/10 (20.12.79) NATIONAL RESEARCH DEVELOPMENT CORP (4pp) (J4 8033088)

Estimating amino acid(s) in blood, urine etc. - using three-part kit comprising ampoules of culture medium, standard amino acid solution and bacteria e.g. *Lactobacillus arabinosis*

AJINOMOTO KK 23.07.76-JA-088523

B04 J04 R16 (27.12.79) *J53015-485 C12k-01

Kit comprises (a) ampoules of culture medium prepd. by sealing a prescribed amt. of liq. medium not contg. the amino acid to be assayed in ampoules and sterilising them; (b) ampoules of standard amino acid soln., prepd. by sealing different amts. of standard amino acid soln., and sterilising them; and (c) ampoules of suitable bacteria.

A series of (b) is added to ampoules of (a) and a prescribed amt. of the test sample is added to ampoules of (c). Ampoules (c) are then allowed to stand at room temp. for restoring, and the bacteria are dispersed in water or salt soln. A prescribed amt. of the suspension is inoculated in the ampoules obtd. in (a) and (b) resp. and the ampoules are, after covering with Al foil, etc., cultured at a constant temp. The multiplication degree of the bacteria can be measured optically by turbidimetric analysis.

Amino acids in blood, urine, etc. can be determined simply and rapidly with high reproducibility, and the results can be utilised for diagnosis. Suitable bacteria are *Leuconostoc citrovorum* ATCC 8081, *Leuconostoc mesenteroides* P-60 ATCC 8042, *Streptococcus faecalis* R ATCC 8045, *Lactobacillus arabinosis* 17-5 ATCC 8014 and *Lactobacillus fermenti* ATCC 9338. 23.7.76 as 088523 C12k-1/00 (27.12.79) AJINOMOTO KK (9pp) (J5 3015485)

Mass-screening analysis for amino-acids - involves impregnating into filter paper, coagulating protein, cutting into strips and treating with culture medium

AJINOMOTO KK 23.07.76-JA-088524

B04 J04 R16 (27.12.79) *J53015-486 C12k-01

Blood samples to be analysed and standard blood gp. contg. the amino acid to be tested, of which amt. is changed continuously, are impregnated in filter paper in disc-form having a prescribed area, and the filter paper is dried. The filter paper is either heat-treated or treated with a protein coagulant. The filter paper is then cut into discs and the discs are further cut into pieces having similar area.

The pieces are put in test tubes, and culture medium for testing bacteria, which does not contain the amino acid to be analysed, is poured into test tubes to dissolve out the components impregnated in the pieces of the filter paper in the culture medium. Previously a prescribed amt. of the testing bacteria is poured in ampoules and they are freeze-dried, sealed and preserved in a refrigerator. The testing bacteria is restored at room temp. and a testing bacteria

suspension is prepd. by suspending the restored testing bacteria in water or physiological salt soln. The testing bacteria suspension is poured in test tubes and they are cultured under the constant condition. After culture the multiplication degree of the testing bacteria is measured by turbidimetric analysis, and the amino acid content in the blood to be tested can be known.

The amino acid content in blood can be determined easily and rapidly. Applicable bacteria are *Leuconostoc mesenteroides* P-60 ATCC 8042, *Leuconostoc citrovorum* ATCC 3081, *Streptococcus faecalis* R ETCC 8043, *Lactobacillus arabinosus* 17-5 ATCC 8014 and *Lactobacillus fermenti* ATCC 9338. 23. 7. 76 as 088524 C12k-1/00 (27. 12. 79) AJINOMOTO KK (6pp) (J5 3015486)

Tomato plant microbiological protection agent - contg. specified passivated tobacco mosaic virus mutant strain to increase immunogenicity

AS USSR GEN GENETIC 22.06.76-SU-374394
C03 (25.08.79) A01n-15 C12k-01/04

Tomato plant vaccination against tobacco mosaic virus is based on plant treatment with passivated mosaic virus mutant strain B-69 to give high genetic stability and longer lasting immunogenic. Strain V-69 is practically non-pathogenic towards tomato (mutation frequency in pathogenic form is 0.3%). Only 0.35-4% of vaccinated plants show symptoms of viral disease after 2 months. The protective effect is developed in 75-90% of treated plants 1 month after continuous infection.

Brewing beer of better storage stability - using strain of barley with very low anthocyanogen and catechine content

FORENEDE BRYGGERIER 15.10.75-DK-004640
E13 (15.05.79) *BE-847-191 C12c-11/04

Method comprises forming a wort from a strain of barley which shows an inherent complete or partial genetic blocking of the synthesis of anthocyanogens (subst. 3,4-flavandiols) or catechines (other subst. hydroxy flavans).

The clouding of beer on storage arises from the presence of these cpds. Removal of these cpds. in the beer e.g. by silica gel or polyvinylpyrrolidone absorption requires a large amt. of additive and involves a further fil-

tration. By use of the above, the stability of the beer is improved without any treatment process.

Protein prodn. by fermentative process - carried out in rotating paddle reactor with reduced energy demand and with higher yields (NL180576)

UHDEFGMBH 16.11.74-DT-454443
(15.05.79) *DT2454-443 +C12d-13/06

The fermentative conversion of a nutrient mixture by microorganisms in presence of oxygen is effected by a phase transformation of the mixture and the gas at a density of under 0.3. The reaction takes place in a closed reactor which is fitted with a distributor, designed as a revolving horizontal shaft with perforated paddles. For the same boundary conditions as conventional fermentation processes, the new method has a much higher productivity as regards energy balance, a higher oxygen yield and a higher final concentration. It is suitable for continuous or batch production.

Centrifuge with closable outlet in basket bottom - in which closure is moved downwards from outlet by sleeve axially displaceable along centrifuge shaft by lever

WESTERN STATES MACH 17.08.78-US-934477
J01 P41 Q66 (17.12.79) B04b F16k

Centrifuge basket is mounted on a base support spaced beneath the bottom wall of the basket and fixed to the lower end of the centrifuge shaft. An opening in the bottom wall surrounds the shaft to allow centrifuged solid material to be removed. The closure moves between the opening and the base support, pref. against the action of a spring on

the support. The sleeve extends upwardly from the top of the closure and has at its upper end an annular channel formation engaged by rollers on the lever.

The lever is forked, with a roller at the end of each arm of the fork, and is pivoted at one side of the shaft. A drive mechanism, e.g. a hydraulic ram, turns the lever, thus displacing the sleeve and with it the closure, downwards. This opens the opening, allowing the solid material to escape.

Centrifuge is used in the sepn. of solids from liqs., e.g. in the extn. and refining of sugar, dextrose and other crystalline materials. The closure is fully supported in both its operative positions, reducing wear, and rotates with the basket, while the lever and drive mechanism are fixed and are sufficiently small not to affect the operation of the centrifuge. 17.8.79 as 878300 (18pp1395).

Dilation process and appts. for cigarette tobacco - to increase filling capacity of the cut material

AMERICAN BRANDS INC 05.09.75-US-610740 (05.09.75-US-610736)

P15 (23.01.80) *BE-845-742 A24b-03/18

The filling capacity of tobacco is increased by entraining a thin layer of conditioned tobacco in a hot gas stream for an interval not greater than 5 secs. The tobacco is conditioned by shredding and heating up to $\geq 130^{\circ}\text{F}$, and raising the moisture content to 15-35%. The gas temp. is above that of the conditioned tobacco.

The gas flow is pref. non-turbulent and may take place in a venturi throat. The max. conditioning temp. is pref. 250°F and the gas stream is from $300-600^{\circ}\text{F}$. Tobacco can be re-constituted without break-up. 29. 8. 76 as 035434 (10pp1376).

Artificial tobacco leaf with raised vein pattern - printed on using tobacco contg. ink, esp. for cigar wrappers

BARNES & HUMBY LTD 06.08.79-GB-027315 (30.05.78-GB-024166)

A97 G02 P15 (23.01.80) A24b-03/14

Prod'n. of artificial tobacco leaf comprises printing, by die stamping or gravure printing, a raised vein pattern of a tobacco-contg. ink onto a paper made of tobacco waste.

Esp. the ink contains tobacco powder and a cellulose base (esp. a nitrocellulose lacquer) and opt. chalk at about the same vol. as tobacco powder. Pref. it has viscosity 200-700P at 25°C . Suitably a reversed line plate pretreated with a silicone is used for gravure printing.

Used esp. as cigar wrappers. By providing a vein pattern a more natural appearance is given to the wrapper. 6. 8. 79 as 027315 (3pp1251).

Tobacco treatment process - using impregnated organic vapour to expand it

REYNOLDS LEASING 28.04.71-US-138039

P15 (08.05.79) *BE-777-252 A24b-03/18

Tobacco treatment process is according to Parent patent with the addition of modification which comprises introducing the tobacco into an impregnation zone, simultaneously introducing, so as to contact the tobacco a vapour current of a compound (I) (pref. an opt. halogenated hydrocarbon) with a b.p. at atmospheric pressure of -50 to $+80^{\circ}\text{C}$, the temp. of the tobacco and the vapour being respectively lower and higher than the b.p. of (I) at the pressure in the zone. The speed of introduction of (I) into the zone is regulated with reference to the ratio of introduction of the tobacco so that the wt. ratio of (I) in the impregnated tobacco is 5-200 pts. wt. (I)/100 pts. wt. tobacco (dry wt.). The impregnated tobacco is then sharply expanded pref. by contact with a stream of warm gas. This process is quicker than that of the Parent patent, (which used a liquid for impregnation) and allows the amount of (I) used to be more accurately determined. Muir, A.G., Newton, D.A. Bul. 17/5.5.79. 14.4.72. as 772591 (4pp)

Decreasing burn rate of tobaccos - by treatment with salt which undergoes endothermic reactions

LIGGETT GRP INC 13.02.78-US-877583 (29.08.74-US-501763)

E12 P15 (E31 E33) (15.01.80) A24b-15 A24d-01

A smoking tobacco compsn. contains 15-30 wt. % of reconstituted and/or burley tobacco, which are the fastest burning components of the blend. These fast burning components have deposited on them 0.1-5 wt. % of a salt, (based on total wt. of salt and tobacco) which on heating from ambient to burning temp. exhibits a secession of endothermic reactions in the range $100-500^{\circ}\text{C}$. The salt is $\text{Mg} \cdot \text{Cl}_2 \cdot 6\text{H}_2\text{O}$, $\text{FeNH}_4 \text{ Cit.}$, $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$, $\text{FeSO}_4 \cdot 9\text{H}_2\text{O}$, $\text{MgH} \cdot \text{Cit.}$, $\text{Na}_3 \text{ Cit.} \cdot 2\text{H}_2\text{O}$, $\text{KAl}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$ (Cit = citrate).

The burning rate of the tobacco is reduced. The effect on smoke compsn. is small and there is no significant alteration in the taste. 13. 2. 78 as 877583 (+22.4.76-US-680637) (6pp955)

Inhibiting corrosion of aluminium tooth-paste tubes - by fluoride contg. tooth-paste with silica thickener, by addn. of sodium or potassium hydroxide or carbonate

BEECHAM GROUP LTD 12.07.78-GB-029588
E34 (23.01.80) A61k-07/16 C23f-11

D/S: E(BE, DT, GB, IT, NL, OE, SW).

Corrosion of aluminium tubes is inhibited by gel tooth-pastes comprising a fluoride source and a silica thickener.

The toothpaste incorporates ≥ 0.01 wt.% (on the toothpaste) of NaOH, KOH, Na_2CO_3 or K_2CO_3 so that the pH of the toothpaste is ≥ 8.5 .

Addn. of the Na or K hydroxide or carbonate reduces the corrosion of aluminium tubes by gel toothpastes contg. fluoride ion source and silica, despite the high pH of the final material. This overcomes gas formation in the tubes and fading of the dyes used in the waste, and enables uncoated aluminium to be used for making the tubes.

3-Alkane-sulphonyloxy-azetidine derivs. - useful for treatment of psoriasis, mycosis and vitiligo

SCHERING CORP 07.11.77-US-849362

B03 (15.01.80) A61k-31/58

Psoriasis is treated by admin. of a 3-alkylsulphonyloxy-

azetidine deriv. of formula (I) or its acid-addn. salts.

In (I) R_5 is H, 3-18C alkyl, 5-15C cycloalkyl, 1- or 2-adamantyl, Ph_2C , Ph-CH_2 , dihydroxybenzyl, dialkoxybenzyl, dibenzyloxybenzyl, 3- (5 α -androstan-17-one) or 3-(5 α -cholestane); R_2 is 1-18C alkyl, benzyl or

polyalkyl; and R_3 and R_4 are H or 1-4C alkyl. Cpd. (I) are new when R_5 is 3-(5 α -androstan-17-one) or 3-(5 α -cholestane).

(I) are useful for topical treatment of psoriasis, mycosis, and vitiligo and for oral admin. to cause remission of psoriatic lesions. Dose is 0.01-5, g/kg. daily. 3 α -(3-methanesulphonyloxy-1-azetidinyloxy)-5 α -cholestane hemimalate (II) is specifically claimed. 7.11.77 as 849362 (Bpp1248)

Mfg. fine para-di:chlorobenzene particles - by addn. to warm water contg. suspending agent, stirring and rapidly cooling

KUREHA CHEM IND KK 27.05.78-JA-062854
C03 E14 (06.12.79) C07c-17/38 C07c-25/08

Prodn. of fine particles of p-dichlorobenzene (p-DCB), comprises (a) adding 1 pt. vol. p-DCB to 0.5-5 pts. vol. water including 0.002-0.1%wt., based on p-DCB, of suspending agent, (b) stirring the liq. mixt. at 55-80°C to disperse p-DCB in warm water, (c) rapidly cooling the mixt. to $<31^\circ\text{C}$., so that p-DCB is solidified to fine particles, (d) washing the particles with water, and (e) removing the particles from the liq. and drying.

The fine particles of p-DCB do not agglomerate, and problems of tableting p-DCB, are obviated. The tablets obtd. are useful as insecticides and anti odorants. 27.5.78 as 062854 (5pp68).

KYOG★ D22 06422C/04 ★J5 4156-809
Lining material for interior walls - having resin coating contg. slowly released cpd. inhibiting fungal growth and microorganisms
KYOWA LEATHER CLOTH 26.05.78-JA-063147
A82 E19 F09 (F06) (11.12.79) D06m-15 D06n-03 D21h-05/22

The material is produced by coating a fibrous base sheet such as paper or textile fabric with a synthetic resin compsn. contg. a compsn. composed of 3-48 wt. % disinfectant chemical, 2-10 wt. % surfactant and 50-95wt. % xylene. The disinfectant being released slowly to the surface (and into the base sheet) to inhibit growth of mould fungi and pathogenic microorganisms.

As the disinfectant, dichlorophene, alpha-bromo-cinamaldehyde, p-chloro-metaxyleneol, etc., are esp. useful. The disinfectant is dissolved in xylene to ensure uniform distribution in the synthetic resin compsn. Addition of the surfactant promotes dissolution of the disinfectant in the solvent, and controls release of the disinfectant.

In an example, 100 pts. of PVC, 50 pts. of DOP, 15 pts. of tricresyl phosphate, 3 pts. of stabiliser and 20 pts. of colourant were mixed to prepare a PVC resin compsn. 100 pts. of the compsn. were mixed with 10 pts. of disinfectant compsn. (3wt. % dichlorophene + 10wt. % polyoxyethylene nonylphenol ether + 87wt. % xylene). A paper sheet was coated with a 6mm thick layer of the resulting disinfectant coating compsn., dried at 140°C in a forced-air oven, and then embossed to give a disinfectant embossed wall paper. 26.5.78 as 063147 (3pp173).

MITR★ D22 06450C/04 ★J5 4156-900
acrylic fibres having disinfectant properties - are formed by two-stage treatment with aq. soln. of sulphuric acid and formaldehyde and aq. soln. of quat. ammonium salt

MITSUBISHI RAYON KK 29.05.78-JA-064169
A14 F06 (11.12.79) D06m-03/18 D06m-13/46

Acrylic fibres with disinfectant properties are formed by connecting quat. ammonium ions to them. The fibres are treated with an aq. soln. containing sulphuric acid and formaldehyde so that carboxyl gp. occupies their outer layer. Pref. amt. of carboxyl gp. on the acrylic fibres is 25-2500 millimole per kilogram. Then, the fibres with the carboxyl gp. are treated with another aq. soln. contg. quat. ammonium salt. Thus, some or the whole of the carboxyl gps. on the fibres is connected to the quat. ammonium ion. Alkyl trimethyl ammonium ion or alkyl dimethylbenzyl ammonium ion can be used as the quat. ammonium ions.

The fibres can be knitted or woven into fabrics and can be used in the prodn. of socks, fishing rope, fishing net, etc. 29.5.78 as 064169 (4pp142).

Absorbent bodies are homogeneous mixts. of an absorbing

material (I) and cotton-like pulp. (I) is a hydrogel which is pref. an alkali metal salt of starch-polyacrylonitrile graft copolymer of particle size 30-200 mesh, bulk specific gravity ≤ 0.3 . The shape of the particles of (I) is irregular and scaly, and they have multiple projections. (I) absorbs ≥ 80 cc/g/hr.

The absorbent bodies are esp. useful as paper diapers, as sanitary napkins, tampons etc. By choosing suitable powder shapes and bulk specific gravities of the hydrogel-forming absorbing material, the body produced has a large initial absorbing rate, large absorbing capacity and improved form stability so there is no danger of leakage or flooding, and it can be worn very comfortably. 31.5.78 as 066226 (10pp55).

Steriliser for objects having different dielectric permittivity - by immersing them in chamber partly filled with disinfecting liquid, using UHF heating energy

GANSHIN S N 13.04.77-SU-473119

P34 (30.06.79) A611-03

Device for sterilising objects having different dielectric permittivities, comprises a chamber, the lower part of which is filled with a disinfecting soln. heater and attachment for distributing the vapour. Sterilisation effectiveness is increased and a steady compatibility is guaranteed during the treatment of the different types of object, by placing a system of UHF energy generation in the lower part of the chamber, to heat up the objects being processed, together with the disinfecting soln. The coefficient of directivity of the UHF emission is regulated, by making each emitter as a funnel from radio-transparent material, plus a rod mounted coaxially inside it and capable of movement.

A97 E34 (23.01.80) C11d-07/60 C11d-17

Detergent compsn. comprises separately (A) as alkaline constituent an alkali carbonate present in excess over (B) an acid constituent which can form water-soluble Ca or Mg salts and/or complexes, and which dissolves more rapidly in the wash liquor than (A). (B) contains 5-30 wt. % (on total compsn.) of ≥ 1 acid of pK 2.8-4.8.

Esp. the compsn. is in the form of a sachet which is permeable to, or disintegrates in, water, esp. it is made of non-woven material and is divided into separate compartments for (A) and (B). Pref. the compartment contg. (A) becomes permeable (or disintegrates) only after 2-10 (3-6) min.; esp. it comprises a (co)polymer of methacrylic acid and/or methacrylate ester and may include hydroxypropyl methyl cellulose.

Phosphates can be replaced by carbonates without problems of accumulating incrustation. Incrustations formed in the preceding washing cycle are dissolved away by (B) before (A) is released to soften the water. 14.7.78 as 829955 (9pp1251).

FUJI ★ D25 06305C/04 ★J5 4155-986
Bleaching yellowed white woollen fibres or fabrics - using a soln. of sodium metasilicate, neutral washing agent and a hydrosulphide
FUJISAKI T 31.05.78-JA-065948
E34 F06 (08.12.79) C11d-03/39

White woollen fibres or clothes are dried by leaving in the sun after washing and go yellow. They may be bleached by immersing in a soln. contg. Na metasilicate, a neutral washing agent, and a hydrosulphite.

In an example, 20 g Na metasilicate, 20 g neutral washing agent and 40 g hydrosulphite were mixed in a bucket. 2 l water and 1 l of warm water were added to the bucket to obtain a dissolved soln. at 40°C. The yellowed woollen fibres or clothes were immersed in the solution, and bleached to give pure white fibres or clothes. 31.5.78 as 065948 (2pp51).

LIOY ★ D25 06458C/04 ★J5 4157-109
Detergent compsn. giving good softness to cloth - comprises alkaline earth salt of an anionic surfactant, cationic quat. ammonium surfactant and inorganic alkaline earth salt
LION FAT & OIL KK 01.06.78-JA-066220
E19 (11.12.79) C11d-01/65

A detergent compsn. contains 5-40wt. % alkaline earth salt of an anionic surfactant having sulphonic acid gp. or sulphuric ester gp.; 0.5-10wt. % quat. ammonium salt type cationic surfactant of formula (I) (where R^1 - R^4 are alkyl, hydroxyalkyl, or benzyl gp., one or two being 8-22 C long chain alkyl; X is a halogen); and 8-80wt. % inorganic alkaline earth salt having >0.1 g solubility in 100 g

water at 25°C. (I) may be replaced by cpd. of formula (II)

(where R^5 and R^6 are 8-20C long chain alkyl).

Detergent compsn. provides superior hand or softness to cloths after washing. 1.6.78 as 066220 (5pp126).

LIOY ★ D25 06459C/04 ★J5 4157-110
Heavy duty liquid detergent compsn. - contg. polyoxyethylene alkyl ether and anionic surfactant, e.g. higher alkyl-benzenesulphonate
LION FAT & OIL KK 01.06.78-JA-066221
A97 (A25) (11.12.79) C11d-01/83

A liquid detergent compsn. contg. block type polyoxyalkylene alkyl-ether of formula (I)

of added ethylene oxide), and anionic surface active agent. The weight ratio of block type polyoxyalkylene alkyl-ether to anionic surface active agent is 1/4-3/2.

Typical anionic surface active agent is (a) 10-14C alkyl-benzene sulphonate (II), (b) polyoxyethylene 11-15C alkyl-ether-sulphate (III) and 0.5-5 mole in average of added ethylene oxide, (c) 11-15C alkyl sulphate (IV), (d) a mixture of >2 kinds among (a), (b), and (c).

Cpd. (II) is a straight chain alkylbenzene sulphonate salt of Na, K, Mg, or triethanolamine. Cpd. (III) is polyoxyethylene alkyl-ether sulphate salt of Na, K, Mg or triethanolamine. Cpd. (IV) is alkylsulphate salt of triethanolamine.

The compsn. has superior detergency and excellent rinsing effect. 1.6.78 as 066221 (5pp126).

Conversion of alpha to beta-type bis:triazinyl:amino:stilbene derivs. - by heating in aq. salt soln., e.g. in aq. acetone with soda ash

SUMITOMO CHEMICAL KK 29.05.78-JA-064627
E13 (12.12.79) C07d-251 C07d-295 C07d-413/14

β -Type crystals of bistriazinylaminostilbene derivs. (I) (where M is cation) are prepd. by heating α -type crystals of bistriazinylaminostilbene derivs. in aq. solvent in the presence of $\geq 4\%$ soln. of inorganic salt(s).

(I) is useful as fluorescent white intensifier for detergent, showing high stability to water and excellent white intensifying potency.

In an example, 6000 pts. of water were added to soln. of cyanuric trichloride (184.5 pts.) in acetone (300 ml). Resultant suspension was condensed with 4,4'-diaminostilbene-2,2'-disulphonic acid (185 pts.) at 0-10°C and then with aniline (93 pts.) at 10-40°C. Morpholine (87 pts.) and NaCl (400 pts.) were added and the resultant mixture was heated at 80-95°C for 2 hrs, while acetone was evapd. Reaction was promoted by adding aq. soda ash to give pH 7.0 to slight alkalinity but regulated to pH 8-11 for β -type crystal formation. Mixt. was cooled at 50-60°C, filtered, washed with 1% aq. soda ash and dried at 80-90°C to give acicular crystals of β -type product (920 parts). 29.5.78 as 064627 (4pp104).

AKCH= ★ D25 07112C/04 ★SU-662-548
Ethoxy-ethylamine intermediate, solvent, plasticiser - prepd. by electro-catalytic reduction of mono:ethanol-amine vinyl ether using nickel coated electrodes

AS KAZA CHEM-METAL 09.01.78-SU-566574

A60 B05 E16 (17.05.79) A61k-31/13 C07c-93/04

Ethoxy-ethylamine is used in the synthesis of anti-diabetic drugs, detergents, emulsifiers, petroleum prods. oxidn. inhibitors, food fats oxidn. inhibiting agent, and also as solvents and plasticisers.

This cpd. is prepd. by electrocatalytic redn. of mono-ethanolamine vinyl ether, using nickel catalyst.

The process is accelerated and the yield of ethoxy-ethanolamine is increased if the electrolyser contains electrodes activated with Raney nickel catalyst satd. with hydrogen, and the process is conducted at 20-40°C using 20-60 A/dm² current density at 47 ml. H₂/min. rate. The yield of final prod. is 85-90%.

Kirilyus, I. V., Shostakovskii, M. F., Minbaev, E. U. et al. Bul. 18/15.5.79. 9.1.78. as 566574 (2pp938)

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose

D1: FOOD; FERMENTATION

D11: BAKING

MAUE- ★ D11 07681C/05 ★DT 2829-910
Air circulation baking oven - controlled by flap valve for separate heating gas ducts to separate decks

MAUERMANN J BACKOFFE 07.07.78-DT-829910
(24.01.80) A21b-01/28

An air circulation baking oven with two decks or more has separate heating gas inflow ducts for each deck but a common duct for the return of the flue gases and a common blower. A flap valve separates the inflow ducts and can be used in a central position where both are open, or in one of the side positions where one duct is shut off.

This creates a simple design which enables the user to control the two gps. of oven decks independent of each other. Automatic controls set a two-stage burner to suit the conditions and actuate the flap valve. 7.7.78 as 829910. (21pp39)

DEBA- ★ D11 07727C/05 ★DT 2830-866
Dough mouldings sprinkling plant - with suction cup head for transferring from sponge plate and dipping in sprinkling material

DEBAG DEUT BACKOFEN 13.07.78-DT-830866
(24.01.80) A21c-09/04

Dough mouldings are sprinkled with poppy seeds, salt, sesame or caraway seed by lifting the inverted mouldings up from a sponge substrate by a head with suction cups. The head with them is dipped into the sprinkling material and then released on to an intermediate tin. The latter is inverted to deposit the mouldings on a baking tin.

This replaces these labour-intensive operations by simple appts., requiring little manual manipulation. 13.7.78 as 830866. (19pp39)

HAAG- ★ D11 07786C/05 ★DT 2926-158
Dough shapes mfr. - between feed roll and moulding roll with roughened surface by sand-blasting prevents sticking (NL 15.1.80)

HAAGSE BAKKERIJMACH 13.07.78-NL-007547
(24.01.80) A21c-11/04

Shapes of dough or marzipan are produced by guiding the paste in a layer over a feed roll which is faced by a moulding roll. The desired shapes are engraved in negative form on the periphery of the latter. A cutter blade skims off the shapes from the periphery of the feed roll. Both the shell and the countersunk shapes are given a rough surface by sandblasting.

The roughened surfaces result in point contact and prevent any sticking of the dough to the moulding roll. Manual powdering of the rolls is not necessary any more and imperfect shapes have been eliminated. 28.6.79 as 26158. (6pp39)

ASH- ★ D11 07845C/05 ★FR 2422-335
Machine for surface slitting bread dough pieces before baking - has main mounted blades which return via continuously moistened cleaning heads

GASHOR-OOMS SA 19.12.78-ES-240261 (10.04.78-ES-468688)
(14.12.79) A21c-11/12

The slits are cut by blades fixed to motor-driven, endless chains. The chains and common drive are mounted on a frame which can be raised or lowered above the loaf conveyor. On the return run of each chain, each blade is drawn through a cleaning head which wipes off particles of dough. Each cleaning head is supplied with a drip supply of water from a common reservoir via pipe-encased capillary mesh.

The mesh is pref. encased in flexible pipes of which the delivery ends can be turned upwards through 90° to curtail water flow to the cleaning heads. The cleaning head pref. comprises a pair of side cheeks spaced with sufficient clearance for a blade to be drawn through the gap. The angle of blade chain path to longitudinal axis of conveyed loaf is pref. adjustable.

The machine is simple and inexpensive. It can be quickly installed by floor-mounting astride an over feed conveyor.

Fillings for bread, biscuits or cakes - which on heating retain their original shape

ASAHI CHEMICAL IND KK 09.06.78-JA-068869
A97 (19.12.79) A23I-01/06

Filling compns. comprise the water-dispersible complex (II) described below, gelling agent (III), sweetner (IV), edible acid (V) and water. (II) is prepd. by grinding a dispersing agent (VI) and a degrading agent (VII) with fine-crystalline cellulose (VIII) in the presence of water and then drying the mixt.

The ratio of (VI):(VII) is 1/9 - 9/1. The content of (VI) and (VII) in the mixture is 5-50 wt. % and the content of (VIII) in the mixture is 50-95 wt. %. (IV) is e.g. sucrose or invert sugar. (V) is e.g. citric acid, fumaric acid or adipic acid. (VI) is e.g. tragacanth gum, carrageenan gum or xanthan gum (VII) is e.g. a monosaccharide, oligosaccharide or modified starch. 9.6.78 as 068869 (5pp42)

BREA= ★ D11 08851C/05 ★SU -663-359

Bread prodn. from surfactant-contg. fermenting dough - includes specified mechanical vibrations applied in two stages before baking to accelerate biochemical processes etc.

BREAD BAKING IND 30.01.78-SU-574876
(28.05.79) A21d-08/02

Prodn. of bread including introducing a surfactant into the dough and subjecting the latter to mechanical vibrations, exerting dispersing effect, is improved by applying the vibrations in two stages with a 5-10 min. interval; the first vibration stage lasts 3-5 min. the second stage 2-3 min. The amplitude of the vibrations is 1.8-2.0 mm; the frequency is 45-60 Hz.

By this method, the biochemical and microbiological processes in the bread are intensified, and its storage stability is enhanced.

Shcherbatenko, V.V., Nemtsova, Z.S., Andruabiva, V. A. et al. Bul. 19/25.5.79. 30.1.78. as 574876 (2pp70)

ELEC- ★ D11 08961C/05 ★US 4184-418

Cooking taco shells on V/shaped former - carried by conveyor and engaging conveyor belt folded round former

ELECTRA FOOD MACH I 07.07.78-US-922652
P28 (22.01.80) A47j-37/12

A conveyor belt carries tacos through a hot oil bath having shaped side-walls which fold it into a V-shape. A set of V-shaped formers is carried by an overhead conveyor in synchronism with the belt. Tacos are sandwiched between each former and the belt and are carried thus through the oil bath.

The side walls of the bath are planar at the inlet and outlet ends of the bath and gradually become more inclined towards the centre where they assume the V profile so as to fold the taco progressively.

The appts. prepares taco shells from uncooked tortillas. The oil bath holds only a small quantity of oil. 7.7.78 as 922652 (7pp295)

PAUL/ D11 86865Y/49 =US 4184-421
Pizza frying pan - with perforated aluminium foil disc supported on flange of bottomless pan to form crinkled edge

PAULUCCI J F 19.05.76-US-687926 (07.02.77-US-766311)

P28 Q34 (22.01.80) *DT2720-238 A47j-37/*

Food can be cooked in an infra-red oven in a disposable cooking sheet and pan liner which is supported in a re-usable rigid annular pan. The pan has a peripheral flange for positioning the sheet on the annular support surface.

The cooking sheet and pan liner is a one-piece soft Al foil of about 0.001 inch thickness and has a webs extending from a complete outer ring into a centre portion. The spaces between the webs allow more than half of the food on the sheet to be browned from underneath.

The webs have circular holes to increase the amt. of space for browning. 10.7.78 as 922901 Div ex 4065583 (+7.2.77-US-766311) (7pp1376)

HURK/ D11 31576B/17 =US 4184-614
Volumetric depositor for paste esp. edible paste - discharges excess material at constant pressure before delivering measured deposit

HURKMANS A 21.10.77-NL-011612

Q32 + R13 (22.01.80) *BE-871-403 A21c-05/02

Dough distributing machine includes a head with a pressure chamber reciprocating sealingly along the end face of a hopper outlet, a dough ejector movable in the head to receive dough by withdrawal in one head posn. and eject it in a second head posn.

A storage cavity with a piston under pressure is filled by the ejector in the second head posn. to accurately meter the amt. of dough, which is expelled from the cavity when the head posn. again changes, pref. when the head returns to its initial fill posn., the dough being then expelled from the cavity into contact with ambient air. 16.10.78 as 951867 (7pp1358)

HOUS- ★ D11 09142C/05 ★US 4185-125
Frying noodles in hot oil - after sepg. and loading into perforated containers with perforated covers

HOUSE FOOD IND KK 27.07.76-JA-088659

(22.01.80) A231-01/16

Raw noddles are fried by forcing the noodles apart, cutting the mass of individual noodles, charging to a perforated container more than 3 cm high and with a frustoconical, pyramidal, cylindrical or prismatic shape, and closing with a cover having perforations forming 5-30% of its area

The covered container is then immersed in oil at 130-160°C until the noddles are homogeneously fried and dehydrated. Oil temp. is pref. $\geq 145^{\circ}\text{C}$. The noddles produced can be stored for extended periods, are not damaged in transportation and become soft and edible when immersed in boiling water for 3 min. 27.7.77 as 819284 (5pp1358)

RADL/ ★ D11 09144C/05 ★US 4185-127
Dry dietary cake mix - contg. fructose as sweetener and glucono delta lactone in baking powder

RADLOVE S B 25.07.77-US-818531

(22.01.80) A21d-13/08

Dietary dry cake mix, comprises (a) non-shortening portion contg. flour, a sweetener, skim milk solids, dried egg whites, (b) shortening portion contg. shortening and emulsifiers, and (c) a baking powder consisting of an alkaline bicarbonate and an acid component.

Improvement is that the sweetener is fructose and the acidic component includes glucono delta lactone. The wt. ratio of the acidic component to the bicarbonate is greater than about 1.5-1.0, and the wt. ratio of fructose to acid component is between 10 and 30, so that when the mixture is combined with water, the batter formed has a pH of 3.5-5.5.

The compsn. contains no sucrose, artificial sweeteners and very little cholesterol. It has acceptable moisture, good volume and texture, and although the sweetener is fructose, it retains an acceptable sweetness during cooking. 25.7.77 as 818531 (7pp955)

D12: MEAT; FISH PROCESSING

NORM- D12 83534W/51 =DS 2523-752
Cutter for removal of tough surface layers - partic. skin from fish fillets, with profiled blade

NORMATIC APS 31.05.74-DK-002966

(24.01.80) *DT2523-752 A22c-25/17

A device for the removal of tough surface layers from food, e.g. for the skinning of fish fillets, consists of a ribbed roll to which the fish is fed. A knife blade has a cutting edge close to and parallel to the roll perimeter. The cutting edge is continued towards the roll by a radiused guide surface so that the skin is carried away through the gap between it and the roll. At the opposite continuation of the cutting edge, another (straight) guide surface for the skinned fillet describes an angle 15° less than normal to the roll surface.

This removes the skin automatically independent of the varying thickness of the fish fillets, without changing the setting of the skinning blade. 28.5.75 as 523752 (5pp39)

VOGT- ★ D12 07678C/05 ★DT 2829-883
Overhead abattoir transport line - with raisable track section for carcass skinning station

VOGT-WERKE KG 07.07.78-DT-829883

(24.01.80) A22b-07

In a processing flow line in an abattoir, the carcasses are conveyed from station-to-station suspended from an overhead track. At a station where the carcasses have to be skinned, a section of the track is offset so that the chain conveyor does not act on it, and this section can be lifted up with the carcass to create enough space at the floor for the skinning roll.

This saves having to excavate a pit for this station which is often impossible. 7.7.78 as 829883. (9pp39)

Friction machine for plucking poultry without tearing skin - has hard surfaced rollers to nip out short feathers

PUJOL M 10.04.78-FR-010711 (09.09.76-FR-027638)

(14.12.79) A22c-21/02

A machine for plucking poultry holds a bird against rotating brushes and rollers which pull out the feathers. The bird is first pressed down on to a pair of parallel rotating brushes which pull out the larger feathers. Fixed on an extension of the brush shaft system is a pair of parallel, spring-loaded contact, rotating rollers covered in a flexible, e.g. elastomeric, material. The bird is transferred from the brush section to be pressed against the rollers which detach the remaining, smaller feathers.

In this addn., the rotating rollers are now made with a hard surface, in partic. metal and pref. stainless steel. Each roller is pref. contacted by a scraper blade to prevent feathers winding around the roller. A positive drive is pref. provided between the two rollers by shaft extensions fitted with meshing, spur gears.

Hard-surfaced rollers have a much longer life than the

previous, pliable-surfaced rollers. The rollers can no longer be made ineffective by being forced apart by material winding around a roller. 10.4.78 as 010711 Add to 9.76-027638 (12pp448)

Hide chain stripper safety enclosure - with spring biased upwardly inclined top door sections for passage of chains and hide
MEADE - LONSDALE GR 12.04.77-GB-014999
(30.01.80) A22b-05/16

A safety enclosure for use in stripping hides from carcasses by pulling upwardly with chains while the carcass is anchored to the ground includes a frame enclosing the stripping station and having a top transverse trapdoor with two hinged sections spring-biased into abutment.

Each section is inclined upwardly from its hinged edge so that chains and hides can readily pass up through the door. The sections are pref. at 30° to the horizontal when the door is closed, and the sections are tapered towards one side to leave a gap between them for free passage of the chains. The arrangement prevents the hide flying in any direction as it is released from the carcass.

Fat premixes contg. $>50\%$ fat are prepd. by (i) emulsifying the fat raw material with a potato protein, (I), which was preliminarily solubilised by an alkali treatment, and (ii) atomising the emulsion obtd. in the presence of a spray-carrier. The alkali treatment-solubilised (I) is claimed.

The prods. can be used in the prepn. of milk substitutes for calves, after mixing with further constituents. High fat-contg. stable emulsions can be prepd. 12.7.79 as 928200. (16pp200)

HERV/ ★ D13 07844C/05 ★FR 2422-324
Cheese making mould assembly - with cavity block fixed to drainage shutter so that curds cannot leak at interface

HERVE Y 11.04.78-FR-011282

P13 (14.12.79) A01j-25/13

The mould cavity block has previously been placed removably on top of drainage shutter which itself sits inside a tray. Even when care has been taken to achieve a close fit between block base surface and shutter, loss of prod. frequently results from leakage of curds at this interface.

The base shutter is now firmly secured to the mould block to overcome this leakage problem. Fixing may be by welding, bonding with adhesive, moulding the two items as a single piece, stapling, riveting, clamping etc. 11.4.78 as 011282 (4pp448)

SALI- ★ D13 07848C/05 ★FR 2422-342
Salting food products esp. cheese, for reduced saltiness - using alkali or alkaline earth metal chloride(s) other than sodium

CIE SALINS MIDI EST 13.04.78-FR-010860

(14.12.79) A23c-19 A23l-01

The process comprises exerting an osmotic pressure on the aq. phase of the products by incorporating or spreading on the surface alkali metal chlorides other than NaCl and/or alkaline earth metal chlorides. The process is applied to the syneresis of the clot in cheese mfr.

The chlorides are pref. used with at least one of NaCl, α - or β -lactose and powdered lactoserum which may opt. be deproteinated, lactose free or de-acidified. The pref. alkaline earth metal chloride is CaCl_2 .

The process reduces the salty taste without affecting the texture or appearance. 13.4.78 as 010860 (5pp597)

PUJO/ ★ D13 07877C/05 ★FR 2422-713
tumbling action laceration to extract oil from olives - with increased capacity by discharging stones and skin directly from laceration zone

PUJOL JF 17.01.78-FR-001162 (27.01.77-FR-002223)

(14.12.79) A23n-01 C11b-01/04

The fruit is lacerated in the first section of a horizontal, rotary drum by tumbling action together with free rolling masses, i.e. ball mill style. In a second section of the drum, the lacerated prod. is strained to separate juice from skin, stones etc.

In this addn., the diametral dividing wall between the two drum sections is now formed as a perforated screen so that skin and stones are retained and only juice allowed to pass into the second section. The retained solids are lifted into an axial screw conveyor which carries them through the second section of the drum.

The first section of the drum is partitioned into sub-sections, each with its own size of free rolling masses. The second section has its own charge of free rolling masses to complete laceration of any fine particles still in the juice.

The output capacity of the lacerating drum is increased. 17.1.78 as 001162 Add to 27.1.77-002223 (10pp448)

Lactic flora bacteria starter concentrate prodn. - includes use of fat-free milk and specified drying process, used in milk prod. mfr.

MILK IND RES INST 04.01.76-SU-309978

(D16) (30.09.79) A23c-07/12 C12k-03

Bacterial lactic flora concentrate for use as starter in milk prods. mfr. from soured milk, is prepd. in industrial conditions without the help of laboratory equipment according to claim in Parent Patent 232905. The prod. activity is increased and the mfr. process is accelerated by addn. of sterile fat-free milk contg. 15-25% solids and mixing the biomass with protective medium (1:4 ratio) followed by saturation of mixt. with air and freezing the resulting foam-type suspension.

The freezing process is conducted at (-50)-(-60)°C and the suspension is then freeze-dried, starting with temp. of (-40)-(-42)°C and ending with 45-50°C. The duration of the drying process is 6-10 hrs.

Storage period determ. of animal origin prod. - involves thin film chromatography and densitometry followed by peak area measurement

REFRIG IND RES INST 31.10.75-SU-187752

J04 R16 (06.07.79) G01n-31/08

Improved accuracy in determining the storage period of lipid extracts or of other products of animal origin is achieved by thin film chromatography with the chromatogram exposed using a colouring reagent. Densitometric analysis and determ. of the ratio of areas below the peak of trace due to free aliphatic acid to that below the peak of cholesterol (taken as a standard) determine the storage period.

The ground muscle tissue is loaded into the vessel containing methyl alcohol, and chloroform is added during stirring followed by addition of distilled water. The mixture is filtered out with paper and transferred to an extn. flask before the analysis.

Yakubov, G. Z., Kargaltsev, N. I., Guslyannikov, V. V. et al. Bul. 24/30.6.79. 31.10.75. as 187752 (3pp89).

Animal feed concentrate prodn. - includes heating, potato juice sepn., concn. by evapn. and freezing and spray-drying

STARCH PROD RES INS 11.10.76-SU-414969

C03 (15.09.79) A23j-01/16

Feed concentrate is produced from the juice of potato cells by coagulating the proteins, filtering them off, and drying the filtrate. This method is improved in that, before the drying, the filtrate is concentrated by freezing to obtain a mixt. of the concentrate and ice crystals; subsequently, the solid phase is sepd. from this mixt. By this method, the quality of the final product is improved, and the loss of solid substances is reduced.

Juice is sepd. from comminuted potatoes by centrifuging and heated to a temp. $\geq 80^\circ\text{C}$ to coagulate the proteins, which are sepd. by filtration. The filtrate is frozen. The ice crystals are sepd. The concentrate is evaporated to a solids content $\geq 50\%$, the product is then subjected to spray-drying, the freezing can alternatively be carried out in two stages. The cost of this process is halved compared with the conventional drying by evaporation (without freezing).

Heat treatment unit for vegetable prods. - uses preliminary oil saturation at controlled temperature and infrared frying

ODESS FOOD SUPPLY 16.03.76-SU-334439

P28 (05.07.79) A231-01/* A47j-37/04

Improved vegetable preserve and lower losses of oil during their heat treatment are achieved by the prelimin-

ary saturation with oil at 70-90°C. Frying then takes place in a fluidised bed using infrared radiation. The frying chamber features an oil bath with an infrared radiator, two additional chambers and a source of hot air ensuring the drying.

The treated prod. absorbs oil during its displacement and the surplus oil is drained through the perforations in the blades. The hot air fluidises the charge, and the infrared radiation ensures frying. The lower losses of oil are due to its reduced amount in the unit and the higher rate of repeat flow.

Prod'n. line for cotton filters for milk - has profiled cutting mechanisms placed across conveyor for material displacement and waste removal

TEXTILE IND DES 20.08.76-SU-400346
F07 J01 (18.05.79) D06c-27

The prod'n. line can be used for cotton filters employed for milk filtering. The line contains an arrangement for material roll unrolling, compensator, bearing plate with clamps for the material, profiled cutting mechanisms, an arrangement for filter stack formation, storing device and a conveyor for material displacement and waste removal. In order to increase the filter cutting quality, the profiled cutting mechanisms are placed across the conveyor for material displacement and waste removal.

The filter stack formation arrangement is placed under the profiled cutting mechanisms and consists of a pulsating conveyor with turning platforms, sloping chute and sprung push rods for platform rotation. The conveyor belt for material displacement and waste removal consists of parallel branches. The conveyor working branches are situated between the bearing plate and material clamps. The profiled cutting mechanisms have knives fitted on a cutting head piece. The head piece can rotate and reciprocate in a vertical plane.

Milk filter prod'n. unit - has various arrangements for prod'n. of glued paper strips with filtering cotton wool between them

TEXTILE IND DES 31.01.77-SU-447867
F07 J01 (18.05.79) D06c-27

The unit can be used for milk filter prod'n. It comprises a filtering cotton wool glued between two paper strips with openings. The unit contains an arrangement for material unloading and profiled cutting mechanism with a drive. In order to automate the prod'n. process, the unit is provided with a rolling arrangement for paper strips and two pairs of transporting rollers for paper strip doubling, two needle rollers for sepn. and transportation of the paper strip, and a pair of pulling rolls for paper strip and filtering material connection. The unit is also provided with an arrangement for application of glue onto one of the paper strips, heating elements for gluing paper strip edges, with filtering cotton between them, and knives for ready filters cutting. One of the knives is kinematically connected to profiled cutting mechanism.

Each needle roller has sprung fork levers for impalling strip onto the roller. The arrangement for glue application onto one of the paper strips contains a bath, whose base has an opening and corrugated roller. The drive is provided with a drive shaft with gears and parallel distribution shaft. The distribution shaft carries wheels with toothed sectors, which contact the gear, and discs with cylindrical protrusions. A plate with cylindrical groove is placed on each gear. The radius of the groove is equal to the disc protrusion radius.

Mfr. of dried oil cake from vegetable matter - esp. lucern, with heat recovery from dehydrator exhaust fumes

SOC INTERET COLLECT AGRI (FRLU-) 25.02.75-FR-005831
C03 Q76 (20.05.79) *FR2302-048 A23k-01/14

Vegetable raw material such as lucern, clover etc., is pressed and heat-treated to produce a dehydrated oil-cake and conc. juice prods. Exhaust fumes from the dehydration operation, which are at about 100°C and at atmos. pressure, and contains a high proportion of water vapour, are passed through a heat exchanger. This condenses some, at least of the water vapour. The heat recovered in this way is utilised in the processing of the oil cake and/or the expressed juice.

Pref. the exhaust fumes are used as a heating fluid in the first effect of a multiple-effect evaporator employed in concentrating serum sepd. from the juice. Residual heat from first effect effluent heating fluid is used to pre-heat juice on its way from the pressing operation to further processing.

Nutrient salt with improved moisture resistance for livestock - is prepd. by evapn. of waste brine obtd. in prodn. of cooking salt

SALT IND RES INST 19.05.77-SU-490811

C03 (28.05.79) A23k-01/17 C01d-03/06

Salt cpds. for livestock can be obtd. by evapn. of mother liquor produced as waste from prepn. of cooking salt. 400 m³ of collected liquor, contg. (in g/l) Na₂SO₄ 52, NaCl 255 and Na₂CO₃S, are evapd. in vacuum to give 130 t. of salt contg. (in wt. %) NaCl 88.7, Na₂SO₄ 10.7 and Na₂CO₃ 0.4. The crystals of NaCl are uniformly coated with a finely dispersed layer of Na₂SO₄, and the coating does not deteriorate over 4 months testing. By comparison, the salt prepd. by mixing cooking salt with a soln. of KI and adding clarified plant sol. to prevent moisture absorption had an unstable coating over the NaCl crystals which was easily damaged.

The starting materials for the improved salt cpd. do not require any pre-treatment, as did those for the previous method, thus reducing costs of prodn. and the apparatus required, and eliminating the salinisation of soil which occurred where the salts were obtd. by the evapn. method. Tests on mice and rats showed a toxic effect only at doses of 18-22 times the normal intake.

(22.01.80) *BE-864-123 A23I-01/27

In the treatment of an acid hydrolysate of protein rich vegetable matter for sepg. it into dark and light coloured fractions, the hydrolysate is contacted with ≥ 1 semipermeable membrane, which is stable in an acidic medium under a pressure of 4-50 kg/cm² to produce a first lightly coloured liquid or permeate which passes through the membrane (the average colour intensity of which, measured by its extinction, is $\sim 1/10$ th of that of the hydrolysate), and a second strongly coloured liquid or retentate which does not pass through the membrane.

The permeate and retentate can be concd. to a paste or dried to a powder and incorporated into food products such as soups and sources as seasonings. The retentate can also be used as a colouring agent as a replacement for caramel. 13.3.78 as 885688 (8pp990)

DYNL ★ D13 09141C/05 ★ US 4185-122
Foam-free aq. soln. coloured with polymeric dye prepn. - by incorporating glycerol mono and/or di:oleate foam inhibitor, esp. used in beverages

DYNAPOL 08.08.78-US-932085
A97 E17 (E24) (22.01.80) A23I-01/27

Prepn. comprises mixing water with the of formula (I) with a foam inhibitor selectd from glycerol mono- and/or dioleate 80-98 (pref. 95)% of the X gps. are -NHCO(CH₃), while the remaining X gps. are -NH₂, a+b+d = 900.

Beverage comprising water, flavouring, sweeteners, (I) and foam inhibitor is also claimed. It may be impregnated

with CO₂. (I) does not contravene U.S. food regulations as it does not have systemic toxicity. The molecular size is 1000-2000 Daltons and thus can not be absorbed through the walls of the gastrointestinal tract.

Meat analogue formed by extruding vegetable protein - in two serially connected extruders one having two chokes

WENGER MFG 15.07.77-US-816005 (26.04.78-US-900071)
(D12) (22.01.80) *US4118-164 A23j-03 A23p-01

Uniformly layered meat analogue is produced at high output by placing hot moist vegetable protein into an extruder barrel, pushing along the barrel to form a compacted mass, moving material away from the mass so that it sub-divides and forms small beadlets, then moving further for uniform heating and distribution of moisture.

The material is then recombined to form another compact mass and this is extruded to form a dense layered product. Material is pref. moved from the first mass into a region of greater free volume, the pressure being such that steam is flashed from it to produce greater subdivision, this steam providing the uniform heating and moisture dispersion. The parent patent claims the appts. 26.4.78 as 900071, Div. ex. 4118164 (11pp1358)

Machine cycle timing controller for dispensing e.g. water and potatoes - with optional pre:rinse and post:rinse stages programmed by logic circuits

JET SPRAY CORP 21.08.78-US-935179
R26 (03.12.79) A23n G05b

An operating cycle timing controller for a machine dispensing a prod. contg. a liq. is claimed. Starting the delivery of prod. initiates a dispensing cycle for raw material. As soon as prod. delivery stops, the end of the raw material dispensing cycle is signalled. The signal also triggers the restart of at least one further complete operating cycle.

The dispensed prod. is pref. a mixt. made in the machine, of the raw material and the liq., in partic. a mixt. of potatoes and water. The cycle pref. includes a pre-rinse stage of water alone. The pre-rinse lasts for a predetermined period and then delivery of potatoes commences. At the end of the main mixing stage, the water supply can be continued slightly after dispensation of potatoes to provide a positive, post-rinsing period. Alternatively, a negative post-rinse can be programmed so that potato delivery continues for a brief period after water supply has been terminated.

Used in cyclic mixing of raw material and a liq. partic.

potatoes and water. Improved quality control of final prod. is achieved. Optional pre-rinse and post-rinse. Easy adjustment of quantity of prod. delivered. 6.8.79 as 878105 (19pp448)

Removable in/line filter for piped liq. partic. milk - esp. for detecting clots in flow from individual cow on milking machine

BULLOCK G P 05.12.78-GB-047195 (09.09.78-GB-036287)
J01 Q69 (17.12.79) B01d F17d

Filter comprises a hollow body with a slot into which a sliding member can be inserted and withdrawn. The sliding member is fitted with a filter element which is made operable by inserting the sliding member. The member is a push fit in the slot so that the assembly is made leakproof simply by insertion of the member. The member pref. has an O-ring on each of its opposite faces, around the element. The O-rings provide a leakproof seal between the sliding member and the filter body. When the sliding member is inserted in the body it pref. provides a restricted by-pass in parallel to the passage through the filter element. The body is pref. made of a transparent plastic such as nylon so that the element can be viewed through the body.

Filter is used specifically to detect clots in milk flowing

through a pipeline, esp. from a milking machine, so that clotting problems can be related to specific animals. It is easily fitted in individual lines of a milking machine. Clotting can be observed through the body without withdrawing the filter element. Milk can continue to flow even when the element is completely blocked. 28.8.79 as 878481 (13pp)

Flotation treatment of polluted liq., partic. cq. emulsion or colloid - circulates liq. repeatedly via reactor and flotation zones (OE 15.11.79)
FUCHS H 25.09.78-DT-841700
(31.12.79) B01d C02c-01/06

An installation for the treatment of polluted liq. is claimed partic. for the purificn. of polluted water. The installation comprise a long, open-topped vessel having a partitioned section at one end to be used as a reactor tank in which the liq. is aerated. The rest of the vessel is supplied with liq. from the reactor tank and is used as a flotation tank with a surface skimmer.

The reaction tank employs a high speed, rotary turbine on a vertical shaft, and the outlet of a pipe delivering gas e.g. compressed air, or a liq. The turbine creates a prim. circulation in the reactor tank which is upwards centrally on the axis of the turbineshaft and down the side walls of the tank. A sec. circulation is induced in the flotation tank; current flows over the partition, longitudinally of the surface of the flotation tank, down its end wall and back along the base towards the partition. The flow path continues through a gap under the partition to join the prim. circulation in the reactor tank. Sedimentation pockets are pref. formed in the base of the two tanks.

Used in floatation treatment of polluted liq. partic. water. This may be combined with neutralisation of detergents and sepn. of sediments. Partic. applicable to the flocculation of colloids and emulsions. Highly efficient flotation is achieved by extensive recirculation of the liq. through the reaction tank for repeated injection of gas etc. 12.9.79 as 878731 (20pp441)

PRZE- ★ D15 07473C/05 ★DL-137-917
Biological sewage treatment tank - with fixed and moving aprons dividing bio sorption from bio-stabilising and settling stage (PT, 27.4.79)

PRZED INS INSTAL 18.07.78-PT-068315 (21.07.78-DL-206863)
(03.10.79) C02c-01/06 C02f-03/12

A circular-tank for the biological cleaning of sewage is divided by concentric fixed aprons into a central biosorption space, a biostabilising annulus and a settling annulus. Revolving aprons divide the first two spaces into two each and have guide floats for the aeration below water level. Both the fixed and the moving aprons are fitted with ribs, vanes and blades.

This creates a compact unit which treats sewage biologically with a high efficiency at low cost, independent of the size of the plant. 21.7.78 as 206863 (16pp39)

Liquid pig manure treatment - by mixing with municipal sewage in specified ratio
INST WASSERWIRTSCHA 24.07.78-DL-206867
(03.10.79) C02c-01/06 C02c-05/10

Liq. pig manure from animal farms is processed by first separating the coarse solids and/or by a prior biological treatment. It is then mixed with municipal sewage and passes through a common clarification, thickening and

activated sludge treatment. The max. biochemical oxygen demand in five days (BOD_5) of the manure can be as much as 95% of that of the mixt. to reduce the BOD_5 per m^3 of the latter from 3Kg to 0.1kg in one or two stages.

This processes liq. pig manure in <24 hrs. to a state fit to be emitted to the waste water drainage system. 24.7.78 as 206867 (7pp39)

WASS- ★ D15 07475C/05 ★DL-137-919
Sewage sludge dewatering - saves flocculants by adsorbing foreign matter on recycled activated sludge
INST WASSERWIRTSCHA 24.07.78-DL-206889
(03.10.79) C02c-03

The liq. phase, derived from dewatering of organic sewage sludge is passed through a biological reclarification. This liq. phase contains solids, colloids, dissolved matter and toxic substances and is mixed with surplus activated sludge from the biological stages. The foreign substances are adsorbed by the flocks of activated sludge and are separated from the flocks and stabilised in a subsequent (anaerobic) stage.

No flocculants are required so that the operating costs are reduced significantly. The sludge is fit to be dumped and the liq. phase is discharged with a minimum of foreign matter. 24.7.78 as 206889 (6pp39)

WASS- ★ D15 07476C/05 ★DL-137-920
Liquid manure treatment - by biological stages and mixing with lightly laden sewage for activated sludge stages
INST WASSERWIRTSCHA 24.07.78-DL-206866
(03.10.79) C02c-05/02

In a system for the treatment of organically heavily laden sewage such as liq. manure from animal farms, a first stage removes part of the organic contents and toxic substances by activated sludge admixture. In a second stage, municipal sewage or lightly laden industrial wastes are added. Solids are separated in a third stage and the remaining fluid is freed from organic components in activated sludge stages.

This processes heavily laden sewage at low cost to acceptable residues without pollution to the environment. 24.7.78 as 206866 (11pp39)

WASS- ★ D15 07477C/05 ★DL-137-921
Liquid manure treatment - by recycled surplus sludge from biological stages and digested sludge
INST WASSERWIRTSCHA 24.07.78-DL-206890
(03.10.79) C02c-05/02

Organically heavily laden sewage, e.g. liq. manure from animal farms, is mixed with surplus sludge from a biological stage and/or with digested sludge, in a ratio of >0.1 pts. by vol. of a sludge to 1 pt. of the sewage. The sludge flocks absorb 30-70% of the organic and toxic substances; they are extracted and digested. The liq. phase is treated on the activated sludge principle.

This system reduces the treatment costs for heavily laden sewage. There are savings in reactor volume and no artificial reagents (slag, activated carbon) are required. 24.7.78 as 206890 (8pp39)

Froth dissipation device - with inclined vanes on truncated cone stator and rotor driven by vertical shaft
LIEPE F 20.07.78-DL-206817
(D16) (03.10.79) C12b-01/18

A device for the dissipation of froth in fermentation engineering, sewage treatment and liq. manure processing includes a housing with an axial cylinder for the ascending supply of froth. A truncated cone system at the top of the cylinder is closed by a horizontal cover plate and has radial stator vanes at an inclination of 30-60°. A rotor with a base plate has radial blades, inclined to the vertical axis of its drive shaft by the same angle.

This breaks up the froth by shear action between stator and rotor blades. The device has a high efficiency, is easy to keep sterile and has a good self-cleaning effect. 20.7.78 as 206817 (9pp39)

LANG/ ★ D15 07490C/05 ★DL-137-943
Froth dissipation device - with inclined stator vanes and wire brushes urged against inclined perforated rotor shroud
LANGHANS G 20.07.78-DL-206818
(D16) (03.10.79) C12b-01/18

A device for the dissipation of froth in fermentation engineering, sewage treatment and liq. manure processing includes a housing with an axial vertical cylinder for the ascending supply of froth. A stator consists of three inclined vanes and three inclined cleaning wire brushes, all equally distributed and at an angle of 45° to the vertical. Springs urge the wire brushes against the expanded metal shroud of the rotor which carries on the other side guide vanes.

This breakd up the froth by a combination of shear action, friction and centrifugal force with a high efficiency and a good self-cleaning action. Froth of high density can be processed at high throughput rates. 20.7.78 as 206818 (13pp39)

LIEP/ ★ D15 07518C/05 ★DL-138-038
Aeration of non-coalescent sewage - by inclined air-fluid injector and submerged stirring mechanism for second dispersion pulse
LIEPE F 31.07.78-DL-207032
(10.10.79) B01f-03/04

Industrial wastes of the chemical industry and municipal sewage which does not impede the coalescence are aerated in a circular tank. A first dispersion pulse is effected by directing a mixt. of recirculated fluid with air through an inclined injector against the surface to produce a circulatory flow of the air bubbles. When the bubbles have coalesced to twice their size, a second dispersion pulse is effected by a driven, nearly horizontal shaft with an impeller.

This system produces an efficient mass exchange for a minimum of power consumption. The settling of sludge at the bottom of the tank is effectively prevented. 31.7.78 as 207032 (17pp39)

RODE/ ★ D15 07519C/05 ★DL-138-039
Viscous liquid metering system - with metering pump passing viscous liquid to intake of mixing and diluent feeding pump
RODEL K 31.07.78-DL-207031
J04 (10.10.79) B01j-04/02

A metering system for liqs. of high viscosity, e.g. flocculant solution in sewage treatment of syrup and fruit extracts in the soft drink industry, uses the diluent tank as a static pressure, storage and overflow vessel. Its outflow pipe feeds a combined mixing and metering feed pump. The flocculant is injected by a metering pump from its storage tank into a point of the suction pipe of the feed pump.

This metering system requires a minimum of appts. It ensures precise dosages of the flocculant and saves flocculant consumption without requiring a safety valve in the system. The feed pump requires no valves which could give trouble. 31.7.78 as 207031 (10pp39)

BUNA ★ D15 07524C/05 ★DL-138-057
Treating aq. effluents contg. polymer dispersions - by addn. of fly ash to break dispersion and ppt. polymer
CHEM WERK BUNA VEB 31.07.78-DL-207027
A35 (10.10.79) C02c-05/02

Effluent waters contg. polymer dispersions are treated with power station fly ash to break the dispersion and to separate the pptd. polymer. Process is efficient, cheap and economical. It is equally suitable for large scale continuous treatment plants and for small scale local discontinuous treatments. The pptd. polymer-contg. sediment can be burnt as a fuel or used as a soil improvement agent.

Process is suitable for treatment of effluents contg. dispersions of butadiene-styrene, ABS, butadiene-acrylonitrile, polychloroprene, acrylic polymers, PVA, PVC, natural rubber etc. The treatment may be carried out e.g. at 0-100°C. Breaking of the dispersion takes place e.g. in 1-20 mins. 31.7.78 as 207027 (10pp513)

Liquid manure decontamination - in steam heated heat exchanger with wall wipers and stirring tank
EICHLER D 16.08.78-DL-207298
(31.10.79) A23k-01

The biosludge, produced by biological treatment plants for liq. manure from animal farms, is passed by a metering pump to a heat exchanger with a steam heated jacket and an inside revolving wiper system which allows only a thin film. The sludge is transferred at 120-150°C to a tank with a paddle mixer. After a retention time of 30 mins. the sludge is discharged through a heat exchanger.

This eliminates incrustations of the biosludge and deterioration of the heat transfer. The heat is efficiently recovered. 16.8.78 as 207298 (7pp39)

KNOS/ ★ D15 07625C/05 ★DL-138-421
Mechanical surface water aeration - by impeller with bottom intake and guided surface outflow in vertical shroud cylinder
KNOSCHER 21.08.78-DL-207387
(31.10.79) C02b-09

A device for the aeration of standing surface waters, to improve the conditions of pisciculture or water supply, consists of an aeration impellet on a vertical shaft which is surrounded by a stationary cylinder. The cylinder has on one side at the bottom an intake opening for the water, and on the surface at the opposite side a delivery outlet for the aerated water. A tangential guide plate extends the outflow opening in the direction of rotation.

These aeration devices can be produced at low cost in large sizes. The intensely directional flow improves the aeration efficiency. Already aerated water is prevented from being recycled. A plate at the cylinder bottom eliminates wash-outs of the floor. 21.8.78 as 207387 (6pp39)

SILC D15 14893Y/09 = DS 2537-640
Treatment of aq. condensates and effluents from coking plants - with alkali salts of weak acids, to expel ammonia
STILL C & CO GMBH 23.08.75-DT-537640
E35 H09 (24.01.80) *DT2537-640 C01c-01/10

Bound NH_3 is expelled from aq. liqs. (I), esp. the aq. condensates from the low temp. carbonisation and coking of mineral coal and lignite, bitumen shales and peat and the waste waters from the processing of low temp. carbonisation- or coking gases (II), in which the NH_3 is bonded to strong acids of low volatility. (I) are mixed with aq. solns. or suspensions of sulphidic alkaline materials, which serve to absorb H_2S from the gases (II); and then the mixt. is heated.

The novelty is that the aq. alkaline solns. used are Na-, K- or Li waste liqs. which have been used for the H_2S washes of coke or sulphur gases which have been previously purified with NH_3 . 23.8.75 as 537640 (4pp481)

Water additives preventing deposit-formation of heating surfaces - prepd. from unsaturated fat derivs. and maleic acid and/or anhydride (NL 16.5.78)

GRILLO WERKE AG (TAPR-) 11.11.76-DT-651438

A97 (24.01.80) *DT2651-438 C02b-05/06

Method for preventing formation of deposits at $\leq 140^\circ\text{C}$. on heating surfaces of appts. through which flows water contg. dissolved inorganic salts comprises adding a water-soluble reaction prod (I) to the water in substoichiometric amts. (I) is obtd. by reaction of (A) an unsatd., non-conjugated aliphatic cpd. having a C chain length of 10-20C and a terminal carboxy, ester or alcohol gp., and an iodine number of 80-200, with (B) maleic acid and/or maleic anhydride.

(A) and (B) are reacted at $150-200^\circ\text{C}$. in the absence of solvents and catalysts, in a ratio of (A) to (B) of 1:1-2.5. Alkali salts of (I) may be used in place of (I). Method is esp. applicable to sea water thermal desalination plants. 11.11.76 as 651438 (3pp927)

STRA- D15 52749B/29 = DS 2800-556
Sewage venting assembly - with ball valve for large vent and cylinder actuated small vent for gas bleed

FA STRATE W 07.01.78-DT-800556

Q66 (24.01.80) *DT2800-556 F16k-24

A venting valve for pipelines, esp. for sewage pipes, consists of a housing with two parallel floats for one large and one small opening. The large float is a ball which seals against a seat at the bottom end of the tube which protrudes downwards in the housing. The small float is a cylinder which terminates in a pin, guided by an O-ring in the smaller seat. The larger seat for the ball is situated at a water level, when the smaller seat has just been closed.

This valve has a simple design and is safe against wedging of both floats. The closure of the large seat causes no pressure peaks and the valve requires little maintenance over long periods. 7.1.78 as 800556 (7pp39)

UGIN D15 06080B/04 = DS 2832-947
Continuous prepn. of zeolite-A of uniform quality - from sodium silicate and sodium aluminate solns.

PCUK-PROD CHIM KUH 29.07.77-FR-023373

J01 (24.01.80) *BE-869-156 C01b-33/26

Zeolite A of constant and uniform quality is prepd. by intensively mixing Na silicate and Na aluminate solns. by continuously feeding the solns. to a turbine positioned between 2 saucer-like plates whose concave surfaces face the turbine and enclose a space into which both solns. are sprayed or sucked.

Crystallisation of the prod. is then effected at an NaOH content of 26-135 g/l. and the crystals are sepd., washed and dried. Starting material requirements are minimised and environmental pollution is reduced. Prod. is esp. useful in washing agents for softening hard water. 27.7.78 as 832947 (7pp927)

STAN- ★ D15 07710C/05 ★DT 2830-514
Desalination plant - with two independent heat exchanger circuits for brine through expansion and heat recovery sections

STANDARD-MESSO DUIS 12.07.78-DT-830514

(24.01.80) C02b-01/06

A desalination plant to produce drinking water from sea water includes an expensive evaporator with multi-stage cooling and heat recovery sections. The heat exchangers in both sections are kept in separate circuits. The brine flows through the heat exchanger and is divided into two strands, pref. of equal throughput, and with an independent control.

This ensures that there is no interruption in the drinking water supply during any necessary cleaning operations or in case of mechanical trouble in one section. No emergency stores of drinking water need therefore be kept. 12.7.78 as 830514. (15pp39)

MAGN- ★ D15 07735C/05 ★DT 2830-956
Water activation system - exposing water molecules to strong magnetic and electric fields

MAGNET ACTIV MUNZER 14.07.78-DT-830956

J04 (24.01.80) B01j-01/10 C02b-09

When water molecules are exposed to the action of a strong magnetic field between two permanent magnets, their dipole moment can be affected so that the molecules become activated. In that state they can cling more strongly to other molecules and ions of organic and inorganic matter and can cure surface tension problems. Apart from the permanent magnets, a Au electrode, contacting the water surface is connected to the positive pole of a d.c. source, and a Pt electrode in the wall of a glass tank forms the negative pole. A crystal at the water surface was kept at 18°C to emit IR radiation in the water.

Magnetised water was used to water plants and resulted in more luxurious growth. 14.7.78 as 830956. (8pp39)

STEM ★ D15 07740C/05 ★DT 2830-987
Potable water producing plant with reverse osmosis system - uses receiver vessels with flexible membrane, and which fill and empty at high and low pressures

STEINMULLER L & C GMBH 14.07.78-DT-830987

(24.01.80) B01d-13

The feed soln. is fed into a vessel contg. a membrane and at the same time spent soln. is displaced from the other side of the membrane. When the vessel is full, valves are changed over to pump the fresh soln. to the membrane unit.

The soln. is pumped at high pressure through the unit and the spent liquor returns to the same vessel but the other side of the membrane. When it has been completely pumped round, the vessels are changed over again to displace the spent liq. In this way the energy consumption is much reduced.

Used for obtaining potable and service water from brackish and sea water. Reduces the energy requirements. 14.7.78 as 830987. (18pp1053)

ZENI ★ D15 07741C/05 ★DT 2830-990
Sludge digestion tower - with rocking sludge distributor and stirrer in gas dome

ZENITH RADIO CORP 14.07.78-DT-830990

(24.01.80) C02c-01/16

A digestion tower for sewage treatment has in its top a gas cowl with a sludge preventer. A tubular frame which can be reciprocated in the gas space is used both for the distribution of the feed of recirculating or fresh sludge and for stirring up the floating sludge layer.

This prevents the formation of a solid crust which would interfere with the digestion process by its detrimental effect on the action of the bacteria. No manual work is necessary and explosion risks are eliminated. 14.7.78 as 830990. (9pp39)

KANZ/ ★ D15 07789C/05 ★DT 2926-520
Pulp waste water purification - by contact with liq. water-insoluble ion exchanger, followed by exchanger regeneration and recovery of chemicals (OE 15.9.79)

KANZLER H 04.07.78-OE-004822

F09 (24.01.80) D21c-11

In process for pulp mill waste water purificn. and for the recovery of chemicals, e.g. SO_2 , chlorides, sulphates, HCOOH , AcOH , furfural, HCHO , etc., the waste waters are contacted counter-currently with liq., water-insoluble ion-exchangers, e.g. phosphate esters, phosphine oxides, sulphonic- and phosphonic acids, or their solns. in water-insoluble, organic solvents, e.g. paraffins.

The ion-exchangers are regenerated and the chemicals are recovered together or selectively, by extn., rectification or by stripping with a base. When lixiviating waters directly from cellulose digestion, the lignin cpds. can be pptd. or flocculated before extn.

Steaming of waste liquors can be avoided. Purificn. can reach 90% in vapour condensates. 30.6.79 as 926520. (7pp200)

NENG- D15 66223Y/37 =GB 1559-809
Ion exchange to remove protein from effluent water - using a cellulose based ion exchange medium

NORTHERN ENG IND (CLAR) 00.00.75-GB-042857

J01 (30.01.80) *NL7702-147 +A23c-09/14 B01j-47/10

Ion exchange between cellulosic medium and proteinaceous liq. is performed in an agitated vessel having a filter at the bottom. The materials are mixed in the vessel and liq. is removed by applying air pressure to leave loaded medium in the vessel. This is then washed and regenerated by adding regenerant which removes proteinaceous material and leaves the medium. The process is then repeated.

The process is used for treating e.g., effluent from food and drink processing plants, such as milk whey. Large throughputs (60,000 gallons/day) can be handled. 20.12.76. (17pp976)

DIAS D15 56148Y/32 =GB 1559-844
Nonflammable, nontoxic compsn. for dispersing oil spillages - comprises ester emulsifier, diester solvent and glycol ether as pour-point depressant

DIAMOND SHAMROCK EU (LANK) 07.11.75-GB-046255

A97 E17 H03 (E14) (30.01.80) *FR2330-653 C02f-01/40

Concentrate for dispersing oil spillages is free from hydrocarbon solvent and comprises (a) 20-75wt.% emulsifier comprising monoester of aliphatic carboxylic acid and polyoxyalkylene glycol, of formula $R-CO-O-(C_mH_{2m}O)_2-H$ (I); (b) 77-15wt.% solvent (II); and (c) ≥ 3 wt.% pour point depressant (III).

(II) comprises a diester of an aromatic or aliphatic dicarboxylic acid with 1 or 2 monohydric aliphatic alcohols, of formula $R_2-OC(=O)-R_3-C(=O)OR_4$. (III) is a monoalkyl ether of (polyoxy)alkylene glycol, of formula $HO-(C_nH_{2n}O)_f-R_5$.

In the formulae, R is aliphatic, hydrocarbyl radical of ≥ 10 C fatty acid; each m is independently 2, 3 or 4; e is integer ≥ 2 ; there is ≥ 1 C_2H_4O gp. per molecule of (I); R_2 and R_4 are each ≥ 5 C aliphatic hydrocarbyl; $-CO-R_3-CO-$ is the diacyl radical of an aromatic or aliphatic dicarboxylic acid; n is an integer 2-4; f is an integer 1-5; and R_5 is 1-6C alkyl.

Detergent concentrate can be diluted on site with sea water or fresh water, is efficient in dispersing the spilled oil and is free from fine hazard. 5.11.76. (12pp936)

Cutting oil-contg. waste water treatment - involves filtration, ultrafiltration, reverse osmosis and final oxidn. step

JAPAN METAL & CHEM 02.06.78-JA-065723

H07 (13.12.79) C02c-05/02

A water soluble cutting oil-contg. effluent, e.g. discharged from mechanical processing, e.g. cutting processing etc. is effectively purified by: introducing it into strainer to filter off coarse floating granules as a sludge; subjecting the effluent thus treated to ultra-filtration to separate it into an oil rich conc. liquor and permeated filtrate;

subjecting the filtrate (COD value is decreased from scores of thousands ppm to 5,000-10,000 ppm in this step) to initial reverse osmosis filtration treatment to remove therefrom the greater part of ions and low mol. material which are not removed by the ultra-filtration > 90% of COD matters are removed in this step); further subjecting the permeated clarified liquor to secondary reverse osmosis filtration treatment under elevated pressure to remove therefrom a remaining portion of ions and low mol. material; and subsequently adding H_2O_2 and iron salt to the clarified filtrate to decompose by oxidn. a remaining portion of organic material. 2.6.78 as 065723 (4pp34)

HIEJ ★ D15 08070C/05 ★J5 4158-059
Purificn. of waste water from chemical copper plating process - involves pptn. in presence of palladium chloride with subsequent oxidn. and treatment with active charcoal
HITACHI PLANT ENG CONST 31.05.78-JA-066132
M11 (13.12.79) C02c-05/02

Organic pollutants are effectively removed from chemical Cu-plating waste water, e.g. contg. EDTA, formaldehyde and Cu etc. by: adding alkali, e.g. NaOH etc. to adjust its pH to > 12; adding $PdCl_2$ and heating at a temp. of 30-80°C to form sediment; and adding mineral acid, e.g. H_2SO_4 etc. to clarified water sepd. from the sediment to adjust its pH to 1-3.

This is followed by sepn. of sediment, adding oxidising agent, e.g. H_2O_2 etc. followed by stirring and addn. of alkali to adjust its pH to 2-4; and subsequently adding activated charcoal followed by solid liq. sepn. The COD of the waste water is effectively lower. 31.5.78 as 066132 (2pp34)

HOOL ★ D15 08071C/05 ★J5 4158-061
Washing zinc phosphate coated metal - with water which is regenerated by DC electrolytic treatment
NIHON PARKERIZING 05.06.78-JA-066814
M13 (13.12.79) C02c-05/12 C23f-07/26

An effluent contg. 0.004-0.4% Zn, 0.001-0.1% Ni, 0.02-2% PO_4^{3-} and 0.01-1% NO_3 , etc., resulting from washing the surface of Zn phosphate film-coated metal is treated with water to remove Zn phosphate chemical treating liquor still adhering after application of the chemical liquor thereon by impregnation or spraying.

The improvement comprises arrangeing alternately anion exchange membranes and cation exchange membranes between cathode and anode, immersed in the washing effluent; passing the washing effluent through each intermediate chamber while passing a direct current, using liquor taken-out from the intermediate chambers as the washing water after the chemical Zn phosphate treatment, and removing conc. liquor from the other intermediate chambers and recirculating a portion or all of it to chemical phosphate film treating vessel.

Thus the amts. of water and chemical phosphate treating agent, to be consumed are reduced without discharge of the polluted washing effluent. 5.6.78 as 066814 (5pp34)

YANA/ ★ D15 08072C/05 ★J5 4158-062
Waste water treatment by insolubilisation and filtration - using a minimum of chemicals and being very rapid
YANAGASE K 03.06.78-JA-066910
(13.12.79) B01d-25/12 C02c-05/02

Waste water is purified without any separation of sediment by converting dissolved harmful components into insoluble fine granules by the use of the minimum amt. of chemicals and immediately subjecting it to filtration in a filter press. The insolubilisation of the dissolved harmful components proceeds rapidly and hardly any ageing treatment is necessary.

In an example, $NaClO$ soln. is added to acidic almost transparent waste water (pH=3.3; Fe^{2+} =26 ppm; Pb^{2+} =5 ppm; Zn^{2+} =8 ppm) to oxidise Fe^{2+} to Fe^{3+} instantaneously. The pH is then made 7 with NaOH soln. to ppte. $Fe(OH)_3$ completely, the Pb^{2+} and Zn^{2+} being coppted. as hydroxides. The liquor obtd. is immediately passed through a filter press to give clarified purified water. An agent may be precoated onto the surface of the filter press to facilitate removal of remaining residues. 3.6.78 as 066910 (6pp34)

NISI ★ D15 08114C/05 ★J5 4158-374
Reducing COD of waste soluble oil used in cold rolling steel - by sepg. into oil and aq. phases and adding hydrogen peroxide in presence of acid
NISSHIN STEEL KK 05.06.78-JA-066795
H07 M21 (14.12.79) C02c-05/04

Waste soluble oil from the cool-rolling of steel plate has its COD value lowered without generation of by-products and sec. contamination by sepg. into oil component and aq. phase, e.g. by salting-out, and subsequently adding to the aq. phase H_2O_2 in the presence of acid, the amt. of which is 0.5-1.5 N calculated in terms of H_2SO_4 , at 60-100°C.

In an example, H_2SO_4 is added to 1 litre waste soluble oil in such an amt. that H_2SO_4 concn. is 1N, followed by heating at 80°C to carry-out salting-out (oil-water sepn.) treatment. The COD value of the sepd. water is 1135 ppm. One gram equiv. of H_2O_2 is added to the sepd. water, followed by oxidn. decomposition at 80°C for 25 mins. and neutralisation with $Ca(OH)_2$ soln. while adding coagulant. The COD value of supernatant liquor was 200 ppm. 5.6.78 as 066795 (4pp34)

Treating waste liq. contg. boric acid from atomic power plant - by passing through ultrafilter to reduce turbidity and passing through ion exchange resin

MITSUBISHI HEAVY IND KK 05.06.78-JA-066744

K07 (14.12.79) C02c-05/02 G21f-09/12

Waste liq. contg. boric acid is drained from an atomic powder plant. Coolant-grade waste liq. contained therein is treated by an ultrafilter to remove a turbid component from the waste liq. The coolant-grade waste liq. is treated with ion exchange to remove ionic impurity materials from the waste liq. The amt. of materials to be solidified is reduced.

Coolant-grade waste liq. is stored in a tank and fed to a circulation tank by a feed pump. The waste liq. is passed through a filter by a circulation pump and fed to an ultrafilter module. The conc. waste liq. is returned to the circulation tank. The filtered liq. is stored in a storage tank and fed to an ion exchange resin column by a feed pump. The treated liq. is stored in a storage tank. The conc. liq. is supplied from the circulation tank to an evaporator. 5.6.78 as 066744 (4pp86)

Reducing COD of sample soln. contg. chlorine ions - by addn. of silver ions so as to ppte. silver chloride and adding more sample soln. to react with unreacted silver ions

SHARP KK 06.06.78-JA-068642

R16 (15.12.79) G01n-33/18

Method comprises adding silver ion to sample water in a measuring tank to react it with the chlorine ion in sample soln. and measuring COD value of the sample water with a fixed reagent. Method includes further introducing fresh sample soln. into the measuring tank to react the chlorine ion in the fresh water with unreacted residual silver ion and recovering the AgCl produced.

The structure of the instrument for the method is simplified and produced at low cost. Salt does not have to be fed to the discharged water as a sample soln. on each measurement. 6.6.78 as 068642 (3pp90)

Polymeric adsorbent for treating waste dye water - prepd. by condensing modified polysaccharide contg. aldehyde gps. with amino cpd. and reacting prod. with polyfunctional crosslinking agent

OTSUKA KAGAKU YAKUHI 06.06.78-JA-068644

A97 J01 (A11) (17.12.79) B01d-15/04 B01j-01/08

The method comprises converting a polysaccharide to a partial aldehyde type polysaccharide, condensing the partial aldehyde type polysaccharide with an amino cpd., and reacting the condensed cpd. with a polyfunctional cross-linking agent to produce the polymer type adsorbing agent.

Pref. the polysaccharide is pulp residue, defatted soybean, or coffee bean extd. residue; the amino cpd. is melamine, aminoethyl cellulose, or albumin; the cross-linking agent is 1,3,5-acryloylhexahydro-S-triazine, hexamethylol melamine, or bis-β hydroxy ethylsulphone.

In an example, 17 pts. of NaO₄ was dissolved in 400 pts. of water to obtain an aq. soln. 100 pts. of pulp residue was mixed with the aq. soln. at 30°C for 1 hour to obtain a partial aldehyde type polysaccharide. The polysaccharide was condensed with 90 pts. of melamine at 90-100°C to obtain a condensed cpd. This was dried to obtain a powder type adsorbing agent. 6.6.78 as 068644 (6pp51)

Effluent purification by biological rotary contactor - which is rotated by air which displaces liquid from radial pockets

AUTOTROL CORP 15.06.73-US-370219

(15.05.79) *BE-816-248 C02c-01/04

The contactor comprises a drum adapted to rotate on a horizontal axis with part of its circumference immersed in effluent liq. Regularly pitched radial pockets are provided around the full circumference of the drum, and air or other oxygenated gas is released below the drum so as to fill pockets on one side only of the axis of the drum with gas, the gas-filled pockets then rising to the surface so that the drum rotates. This form of drive is cheaper, more compact and less troublesome than conventional drive by electric motor, gears, roller chain etc. The gas liberates supplementary oxygen which accelerates the purificn. treatment, and the pockets provide extra area for the growth of biomass. Waste water treatment system with annular ridges - planted with grass compatible with heavy irrigation

CAMPBELL SOUP CO 25.08.78-US-936739

P13 (22.01.80) A01g-25 C02c-05

A system for treating waste water comprises utilising a circular land surface area having relatively impervious

soil. The area is contoured to provide a series of concentric annular terraces each sloping down radially towards a concentric annular drain.

A water-tolerant grass crop is grown on the terraces and a distribution device is used to deliver the waste water to the grass on each of the terraces. The gradual slope of the terraces allows a slow movement of the water through the crop to the adjoining drain. The distribution device comprises a radial conduit pivotally fixed at the centre of the terraces and adapted for movement around the area. The conduit has a series of spaced nozzles along its length

The system is partic. for treating waste water from food processing plants but may also be used for treating sewage. 25.8.78 as 936739 (11pp295)

Tetanus vaccine prodn. from intracellular toxin - recovered by saline extraction of bacterial cultures, free of ballast materials

SACHSISCHES SERUMWE 04.08.78-DL-207116

B04 C03 (24.10.79) C12k-05

Prodn. of tetanus vaccine comprises using as toxoid an intracellular toxin prped. from a sedimented and washed bacterial mass by extraction with aq. soln. solns., esp. isotonic NaCl soln. The toxoid can be processed to give a fluid vaccine or, after adding an inorganic adsorbent, an adsorbed vaccine. Alternatively it is combined with other immunogens to give a multivalent vaccine.

The vaccines are useful in human or veterinary medicine.

The toxoid is obtd. free of ballast materials which may cause local or general reactions; it has purity >1000 Lf (flocculation units) per mg. N. 4.8.78 as 207116 (6pp)

Gonorrhoea antibodies detection - using radioactively labelled heat-sensitive neisseria gonorrhoeae antigen

RESEARCH CORP 12.07.74-US-487971

B04 K08 R16 +P31 R19 (24.01.80) *DT2531-176 G01n-33/16

Neisseria gonorrhoeae antibodies are radioimmunologically detected in human serum by converting them to radioactively marked antigen-antibody conjugates, with the help of heat-sensitive antigens produced in a culture of Neisseria gonorrhoeae and antihuman IgG.

The method comprises (a) mixing the serum with an aq. buffer and antihuman-IgG, (b) adding radioactively marked, heat sensitive antigens to the mixt., (c) incubating the mixt. for 2-24 hrs. at 4-45°C. and pH 6.5-8.6, and (d) determining the degree of radioactivity of the conjugate formed in (c) in the presence of antibodies.

Used for large scale screening for existing or previous gonorrhoeae infections, the method is simple, rapid, sensitive and specific. 11.7.75 as 531176 (5pp913)

Enzymatic analysis using NADH or NADPH - with preliminary enzyme reaction to remove interfering substances without lag phase

BOEHRINGER MANNHEIM GMBH 08.08.78-DT-834705
B04 J04 R16 (24.01.80) G01n-31/14

In enzymatic analyses involving formation of reduced nicotinamide adenine dinucleotide or its phosphate (NAD(P)H) in which intermediates and non-specifically reacting substances are subjected to preliminary reaction, an NAD(P)H consuming enzymatic reaction is carried out simultaneously with the preliminary reaction so that the NAD(P)H form formed is oxidised completely to NAD(P).

The preliminary enzymatic reaction is terminated at the start of the measuring reaction, pref. by adding an inhibitor or removing the second substrate. Novel reagents for the process contain the NAD(P)H oxidising system and a terminator.

The process can be used in clinical, pharmaceutical, biochemical and food applications, for determining substrates or enzymes in serum, body fluids or other samples. Interfering intermediates, foreign substrates, etc. are eliminated without a lag-phase in the determn. 8.8.78 as 834705 (12pp941)

Glycerol oxidase - used for quantitative determination of glycerol, e.g. in serum tri:glyceride level measurement
KYOW HAKKO KOGYO CO 21.07.78-JA-088261
B04 R16 (30.01.80) C12n-09/04 C12q-01 G01n-33/52

An oxidising enzyme of glycerol, glycerol oxidase (II, having the following properties, is new: (1) activity: oxidises glycerol in the presence of O_2 to form H_2O_2 and glyceraldehyde; (2) substrate specificity: a specific activity for glycerol and dihydroxyacetone; (3) optimum pH: 7.8-8.6; (4) stable pH: 7.5-10.0; (5) optimum temp. for action: $37^\circ C$; and (6) Michaelis constant against glycerol (K_m value): $8.0 \times 10^{-3} M$.

Quantitative determination of glycerol comprises enzymically oxidising the glycerol using the above enzyme in the presence of O_2 , and measuring the quantity of O_2 consumed, or the amt. of H_2O_2 produced, or the amt. of glyceraldehyde produced.

The enzyme is heat-resistant and has low K_m value, and it directly oxidises glycerol to form H_2O_2 stoichiometrically. The obtd. H_2O_2 or glyceraldehyde can easily be converted to a colouring system and the glycerol determination effected colourimetrically. The determination can be used in biochemistry, e.g. to measure triglyceride levels in serum (by hydrolysing the triglyceride to form glycerol and fatty acid, followed by measuring the glycerol as above). 19.7.79 as 025258. 3-Alpha-hydroxy-steroid dehydrogenase - useful in analysis of bile acid in body fluid or excreta

CALPIS SHOKUHIN KOG 16.05.78-JA-057124
B04 (B01) (13.12.79) C12d-13/10
3 α -Hydroxysteroid dehydrogenase (I) which has optimum pH 10.0-10.5 and optimum temp. of $30-40^\circ C$ is new. Stability of (I) can be increased by the existance of glycerin, DMCO, Co^{2+} , Mg^{2+} , or Ca^{2+} without need of mercaptoethanol as a stabilising substance, (I) dehydrogenates the 3 α -positioned hydroxyl gp. of steroids to form 3-ketosteroids.

(I) is prepd. by cultivating a microorganism belonging to genus *Bacillus* (e.g. *Bacillus sphaericus* C-1163, FERM -P No. 4483) and recovering (I) from the culture.

Prepn. (I) contg. liquid comprises heating the enzyme contg. liquid obtd. during purification of the culture in the presence of a stabiliser.

(I) is useful as reagent in trace analysis of bile acid in the body fluid or the excretion. (I) has good thermal stability. 16.5.78 as 057124 (12pp14)

Entomopathogenic microorganisms culture medium - contg. corn extract and polysaccharide e.g. starch base, useful in biological plant protection

MICROBIOL PLANT PRO 05.01.70-SU-393376
(15.09.79) C12d-07 C12k-01/06

Nutrient medium, contg. corn extract, carbon and nitrogen source cpds. and mineral salts, is used in growing entomopathogenic microbial biomass for control of insects which damage plants in agriculture, forestry etc.

The nutrient produces highly active microbial spores by the addn. of polysaccharide. The latter can be added to the nutrient in a pure form or as a component of the mixt. contg. other nutrients, (e.g., corn flour, starch contg. waste etc.).

Corn extract and polysaccharide based microbiological nutrient increased the yield of biomass and the concentration of microbial endotoxins. The biomass prodn. cost is reduced, owing to the low cost nutrients.

Crude wine alcohol extractor - has sections connected to fractionation column by separate pipes with distillation residue transfer holes controlled by discs

GEORG SAMTREST IND 25.07.77-SU-510517
(30.12.78) C12f-01/02 C12g-03/12

Metered feed of lees and yeast residue into the section of the low-wines forming unit, and reduced losses of the final prod. are achieved with perforated discs carried on the shaft. The perforations form a channel for the product and features tubes, while each section is connected to the alcohol vapour discharge tubes of the fractionation column via a header. The first three sections have additional pipes for reflux from the dephlegmator.

The lees and residues are fed to the top section with the disc covering the discharge tube, and when the fill is completed, the float valve stops the inlet. With all sections loaded, the level sensing unit stops the pump, and the transfer takes place when the opening of the rotated disc is aligned with the discharge. The sections ensure the evaporation of alcohol with vapour diverted to the fractionation column, while the enriched vapour of alcohol is fed to the cooler.

Unit for must sulphitation in wine-making - includes a refractometric transducer for determining sugar content and proportional metering of sulphur dioxide

GEOR SAMTREST (INPR=) 13.04.77-SU-477272
(25.05.79) C12g-01/02

Precise metering of SO₂ for treating the wine material is controlled by the refractometric transducer and display instrument the shaft of which carries a contact roller. The end of the disc has plates corresp. to the given sugar content in the must, and the line feeding SO₂ to the tank has servo valves connected to the plates via delay lines.

The freshly-pressed must is fed to the tank, and when its level reaches a set limit, the transducer provides a signal to the relay and the valve stops the inflow. At the same time, the solenoid valve opens up the flow of must to the cuvette of refractometric transducer for measuring the sugar content and the signal is transmitted for recording. A delayed signal is fed to the solenoid valve for metering the SO₂ in accordance with the sugar level in the must.

Frozen microbial biomass disintegrating extruder - has pneumatic drive with piston rod carrying head of plunger, used in immunological laboratory etc.

AS USSR MICROORG (ASCH=) 23.12.77-SU-559897
(25.05.79) C12k-01/10

Maintenance of given parameters for disintegration of frozen biomass during the extrusion is ensured with a pneumatic chamber of the drive. The chamber houses a spring-loaded piston with rod carrying the holder of the plunger head. The unit features adjustment of compressed air flow rate into the chamber to match the temp. of the extruded biomass.

The adjusting mechanism comprises a solenoid valve connected to the compressed air pipe and to the pneumatic chamber. One input of the comparator is fed by the temperature setter while the other input is connected to the amplifier while the output controls the solenoid valve. The low inertia of the feedback prevents sudden breaks in the biomass flow, and increases the yield.

Stable, carrier adsorbed enzyme substrate compsns. - useful as time-temp. indicating device

KOCKUMS CHEMICAL AB 06.09.77-US-830957 (18.04.74-SW-005199)

B04 R16 (22.01.80) G01n-31/14

Compsn. capable of undergoing enzymatic reaction and indicating the formation of the prod. of the reaction consists of (a) a suspension of a carrier-substrate combination comprising (i) a solid, granular carrier of specific surface area 50 m²/g and (ii) a substrate (I)-contg. layer adsorbed on the carrier and prepd. by impregnation of the carrier with a non aq. (I) soln. followed by removal of solvent; (b) an enzyme for (I); and (c) an indicator to indicate the formation of the reaction prod.

(I) is an enzymatic substrate capable of undergoing an enzymatic reaction, has H₂O-solubility 0.1% by wt. at 20°, is stable and free from hydrolysis and dissolution in the absence of its specific enzyme, and is inert towards the carrier.

The simple, inexpensive compsn. contg. (I) adsorbed on the carrier is esp. useful for the standardisation and characterisation of enzymes, e.g. indicators in the time-temp. response indication of foodstuffs. 6.9.77 as 830957 Continuation of 4043871 (clg. 25.4.73, 18.7.74, 31.3.77-US-354412, 489667, 783509)(6pp478)

Cell culture in tube with two perfusion circuits - as interwoven ultrafiltration fibre bundles operated at different pressures

US GOVERNMENT 11.11.77-US-850810

(22.01.80) C12k-01/10 C12k-09

A cell culture unit includes a tube through which passes a bundle of capillary fibres. The fibres are interwoven in a predetermined sequence and the ends are interconnected so as to form two parallel yet isolated fibre bundles. Permeate is passed through each of these bundles but at different pressures. Cells may be seeded and retrieved from the extra capillary space e.g. by conduits connected to the tube.

The device provides a matrix or the high density growth of cultured cells in a continuous perfusion system. The unit can permit the observation of mass transfer of chemical species from one perfusion circuit into the other through the cell mass and induction of fluid filtration between perfusion circuits simulates lymphatic drainage of the cell mass.

The pressure difference between the two perfusion circuits produces convective currents in the extracapillary space and improves nutrient distribution. 11.11.77 as 850810 (7pp295)

Sieves, esp. for used in continuous sugar centrifuges - made by electroforming of nickel covered by copper and then etching the copper with sodium chloride soln.

BALCO FILTERTECHNIK GMBH 05.07.78-DT-829529

M14 P75 (24.01.80) B41n-01/24 C25d-01/08

The sieves are made by electroforming, starting from an electrically conducting master or former which has both conducting and nonconducting zones on its surface. Electroforming is used to cover the conducting zones with a metal, followed by interrupting the process and then depositing another metal on metal to form a sieve with the desired thickness, but where some of the sieve slots have been closed by the sideways growth of metal during electrodeposition.

The sieve is next removed from the former, and is treated with a liq. etchant which dissolves metal but which does not attack metal. Etching is continued until the slots or holes in metal are opened to the required size. The etchant is pref. sprayed upwards through the holes in

metal onto metal.

Sieves contg. holes only 0.04-0.06 mm. wide can be made with smooth, tapered walls on the holes. 5.7.78 as 829529. (16pp1144)

Dressing fur skins - using water-insol. aluminosilicate as tanning agent

HENKEL KG AUF AKTIEN 21.07.78-DT-832089
E33 (30.01.80) C14c-03/04

Fur skins are dressed using an H_2O -insol., Al silicate of formula $(M_2/nO)_x \cdot Al_2O_3 \cdot (SiO_2)_y$ (I) as the tanning agent. (I) has Ca binding capacity 0-200 mg. of $CaO/g.$, and particle size 0.1 μ -5mm. In (I), M is alkali metal ion and/or a divalent and/or a trivalent cation; $n = 1-3$; $x = 0.5-1.8$; $y = 0.8-50$.

Use of (I) alone as tanning agent gives a degree of tanning sufficient for fur pelts, and much higher than that obtd. with basic Al tanning materials. A thin, light, soft leather skin is obtd., and the shrinkage temp. is 10-12° higher than that from conventional processes. Tanned skins are more resistant to toners and bleaching agents, and give better results in the dyeing process. In addn., (I) are non-toxic, unlike e.g. chrome tanning agents. 20.7.79 as 025456. Liq. cleaning compsns. contain anionic (I) and cationic (II) surfactants at a mol. ratio of (I):(II) = 8-1:1 (pref. 4-1:1) and at (I) + (II) = 1-40 pref. 5-25 wt. %. R' is 8-16C alkyl. R'' is H or CH_3 . m is 1-6. M is alkali metal, ammonium or organic amine, R_1 is 8-14C alkyl. R_2 and R_3 are each CH_3 , C_2H_4OH or $(C_2H_4O)_2H$. R_4 is CH_3 , C_2H_4OH , $(C_2H_4O)_2H$ or benzyl. X is halogen, CH_3SO_4 or $C_3H_5SO_4$.

(I) is e.g. the sulphate ester salt of an alkylether obtd. by the addition of 3 mols. of ethylene oxide to lauryl alcohol or the sulphate ester salt of an alkylether prepd. by the addition of 3 mols of ethyleneoxide to an 11-15C aliphatic satd. alcohol made by oxosynthesis. (II) is e.g. octyltrimethylammonium chloride, lauryltrimethylammonium chloride, lauryldimethylbenzylammonium chloride. Compsns. may also contain fillers, builders, dissolving aids, pH modulators, stabilisers, perfumes, pigments etc. 7.6.78 as 068534 (6pp170)

NISW ★ D21 08372C/05 ★ J5 4160-314
 Esterified cpd. useful in cosmetic materials - obtained by reacting modified polymer poly:ol with satd. aliphatic di:carboxylic acid and/or hydroxy:di:carboxylic acid

NISSHIN OIL MILLS KK 07.06.78-JA-067812

A96 (A25) (19.12.79) A61k-07 C07c-69/34 C08g-63/46

The esterified cpd. is obtained by reacting (I) a modified polymer polyol formed by the addition of ethylene oxide and/or propylene oxide to a tetravalent or higher polyhydric alcohol (mole number thus added per molecule of the polyhydric alcohol being 0-20 mol. of ethylene oxide, 0-100 mol. of propylene oxide, and the total mole number of ethylene oxide and propylene oxide thus added being not lower than the number of OH gps. of the polyol), and (2) a satd. aliphatic dicarboxylic acid and/or hydroxydicarboxylic acid.

The esterified cpd. functions as a gelling agent, dispersing agent, solubilising agent and moisture-retaining agent, and, therefore, a cosmetic agent contg. the cpd. is pref. used as a skin cream or lotion, or as a hair cosmetic. 7.6.78 as 067812 (6pp75)

DAUC ★ D21 08373C/05 ★ J5 4160-315
 Pantethine fatty acid ester(s) - useful in cosmetics for accelerating secretion of sebum

DAICHI SEIYAKU KK 05.06.78-JA-066768

E17 (19.12.79) A61k-07/06 C07c-149/42

Pantethine fatty acid esters are of formula (I)

where R is 10-20C alkyl.

A specif cpd. is 2', 4'-dipalmitoyl-pantethine. The compound esters have an excellent action for accelerating the secretion of sebum, and thus are useful in the cosmetic field.

The esters can be prepd. by subjecting pantethine to conventional acylation reaction. In an example, pantethine is dissolved in a solvent having deoxidation effect, (e.g. pyridine), and the soln. is allowed to react with a slight excess of fatty acid halide, pref. 1.1-1.3 times excess. The reaction proceeds at room temp. and usually completes in several hrs. 5.6.78 as 066768 (3pp75)

FUJI/ ★ D21 08412C/05 ★ J5 4160-406
 Aerosol hand cleaner compsn. for use when water is not available - contg. liq. paraffin, nonionic surfactant, lanolin and water

FUJINOK 08.06.78-JA-069674

(19.12.79) C11d-01/66 C11d-03/38 C11d-10/02 C11d-17

Hand cleaner is prepd. by filling an emulsion of liq. paraffin, nonionic surfactant, lanolin and water together with an inert gas into an aerosol.

Prod. is used to clean hands where water cannot be used. No tackiness remains when hands are wiped, e.g. with tissues. Addn. of perfume is unnecessary because agents derived from petroleum and having disagreeable odours are not used. Skin is prevented from chapping by including lanolin.

Pref. the compsn. is 50 vol. % liq. paraffin, 20 vol. % nonionic surfactant, 10 vol. % lanolin, and 20 vol. % water. Pref. inert gas is Freon. 8.6.78 as 069674 (3pp126)

KURS ★ D21 08421C/05 ★ J5 4160-439
 Adhesive for bone and tooth enamel - contg. phosphoric acid cpd. or polymer produced from it

KURARAY KK 08.06.78-JA-070051

A96 E11 P32 (19.12.79) A61c-05 A61f-01 C08f-20 C09j-03/14

The adhesive contains a phosphoric acid cpd. of the formula $P(=O)(R^1)(R^2)OH$ (where R_1 and R_2 are each 1-25C organic residues having a mol. wt. of ≤ 500 , ≥ 1 of these contg. a polymerisable gp.) or a polymer in which the phosphoric acid cpd. is one component, in an amount of 0.1-10 wt. % calculated as phosphorus.

It gives strong and stable bonding and is harmless to the body. 8.6.78 as 070051 (8pp119)

Cosmetics contg. pantetheine fatty acid ester(s) - to increase the sebum secretion rate

DAIICHI KOGYO SEIYAKU (DAUC) 05.06.78-JA-066769
E16 (19.12.79) A61k-07/02

Novel subum-scretion-accelerating agents contain a pantetheine fatty acid ester of formula (I) as the principal component. In the formula R is a 10-20 alkyl gp.

(R.COOCH₂.C(CH₃)₂CH(OCOR)-CONHCH₂CH₂CONHCH₂CH₂S-)₂.

Agents are used in cosmetics, e.g. face-creams.

(I) is palmitoyl pentetheine. (I) are novel cpds. pref. prepd. by acylating pantetheine, esp. by room temp. reaction in pyridine soln. To prevent (I) crystallising out of cold cream, it is pref. blended into squalane at 5-20% by melting. 5.6.78 as 066769(3pp42)

LIOC ★ D21 08543C/05 ★ J5 4160-752
Liq. medicinal compsn. for preventing dental caries - contains polyacrylic acid, polymethacrylic acid or their alkali metal salts

LION DENTIFRICE KK 12.06.78-JA-070523
A96 B04 (19.12.79) A61k-07/16

The compsn. (I) contains > 0.005 wt. % of polyacrylic acid (II), polymethacrylic acid (III) and/or their alkali metal salts (IV). (I) is used in a gargle, oral-wash, oral-spray, etc. (I) has high activity for preventing the formation of dental caries.

Although mol. wts. of (II), (III) and (IV) are not limited usually mol. wt. of Na polyacrylate is 1-6 million. The chemical structures of (II), (III) and (IV) may be straight or branched. The content of the sum of (II), (III) and (IV) is usually 0.005-3 %. When (II), (III) and (IV) are mixed with a cpd. which release polyvalent ion, the activity for prevention of dental caries-formation is suppressed.

Therefore, in these cases, salts of pyrophosphoric acid, tripolyphosphoric acid, trimetaphosphoric acid, etc. are added in (I) as masking agents. 12.6.78 as 070523 (7pp)

Candle giving coloured flame - comprising main burning agent consisting of ethyl carbamate and synthetic resin, burning wick and colouring wick

PEGASUS CANDLE KK 07.06.78-JA-069234

A95 E37 (18.12.79) C11c-05

The main flammable material consists of a mixture of ethyl carbamate and a synthetic resin (e.g. vinyl acetate-maleic anhydride copolymer, or vinyl acetate - acrylate copolymer).

The burning wick is composed of a combined or stranded yarn on which a pro-oxidant catalyst e.g. Pt, Pd or V is absorbed, and the colouring wick, arranged close to the burning wick, is composed of a flammable yarn-like material (e.g. of cotton), a colour-burning layer of a colour-burning metal cpd. (e.g. hydrochloride, nitrate, hydroxide, oxide, or acetate of Co, Cr, Cu, K, Na, Li, Mn, Sb, Ca, Ba, Sr, Cs or Rb) a pro-oxidant catalyst, and a binder of synthetic resin applied on the wick, and a flammable synthetic resin coating (e.g. of polyethylene).

A clear coloured flame (e.g. red, blue, yellow, violet or white) is obtained using the candle. 7.6.78 as 069234 (5pp30)

Hardened oils with high plasticity over wide temp. range - prepd. from alkali metal catalyst and pure or mixed oils

FUJI OIL KK 26.03.73-JA-034342

(08.01.80) *J49121-808 +A23d-05 C11c-03/10

Hardened oils are produced in the presence of an alkali metal catalyst (e.g. Na methoxide) from pure or mixed oils.

In an example, palm oil 50 and rape oil 50 parts were dehydrated in a reaction vessel at 110°C for 10 min under reduced pressure (2-3 mm Hg) The oil mixt. was cooled to 60°C and then pressure was returned to normal with N gas. Na methoxide 0.5 part was added to the oil mixt. which was esterified at 60°C for 40 min and at 20°C for 20 hr. Water was added to inactivate the catalyst. The reaction prod. was worked up to obtain hardened oil. The solid fat indexes of the prod. were 20.0, 17.5, 14.5, 11.5, 4.5, and 0 at 5°C, 10°C, 20°C, 30°C, 40°C and 45°C. resp. 26.3.73 as 034342 C11c-3/10, A23d-5/00 (8.1.80) FUJI OIL KK (8pp)(J49121808)

LION FAT & OIL KK 23.05.75-JA-062390
 E17 (E36) (22.01.80) *DT2622-057 C07c-143/02
 Water-soluble olefin sulphonates obtd. by sulphonating 12-22C olefins, neutralizing and hydrolyzing are bleached by (i) adding 2-7 wt. % Na and/or K pyro-, tripoly- and/or mono-phosphate in soln. at $30\text{-}130^\circ\text{C}$ and pH 7-12; (ii) adding 0.1-10 wt. % (w. r. t. olefin sulphonate) of H_2O_2 and (iii) keeping at $30\text{-}130^\circ\text{C}$ until the olefin sulphonate is bleached.

Pref. the H_2O_2 is at 0.5-5 wt. %. Pref. the olefin sulphonate is an Na salt of a 16-18C α -olefin sulphonate. Pref. (ii) and (iii) are at $50\text{-}100^\circ\text{C}$. Pref. the substance added in (i) is Na tripolyphosphate. 8.5.78 as 903396 (clg. 4.5.76-US-686382)(5pp974)

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
A+	Polymer Applns.	G	Printing, Coating, Photographic Chemistry
AE	Polymer & General Chemistry	H	Petroleum
B	Pharmaceuticals	J	Chemical Engineering
C	Agricultural Chemistry	K	Nucleonics, Explosives, Protection
D	Food, Disinfectants, Detergents	L	Refractories, Ceramics
E	General Chemistry	M	Metallurgy
E+	General Chemistry Applns.		

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

D1: FOOD; FERMENTATION

D11: BAKING

DEBA- D11 09899U/08 = DS 2137-770
Automatic bakery plant - esp for bread roll prodn
DEBAG DEUT BACKOFEN (DEB-) 28.07.71-DT-137770
+ Q35 (31.01.80) *DT2137-770 A21c-09/08

A transfer device for lumps of dough from an endless chain conveyor with rocking troughs to a discharge carrier has along the upper strand of the conveyor a control rail on which the rollers of the hinged trough levers run. The rail is moved down in a parallel motion to cause the troughs to discharge the pieces of dough, by an eccentric drive on both ends. The eccentric drive is actuated by a feeler above the conveyor which enters the troughs and detects the presence of a lump of dough.

The result is a gentle tipping motion and a complete charging of the discharge carrier. 28.7.71 as 137770 Div. ex 2167135(11pp39)

CHFW ★ D11 09267C/06 ★ DS 2851-053
Whole-meal bread mfr. - with admixture of partly germinated grains dried and extruded at specified temp. and pressure
WERNER & MERTZ 25.11.78-DT-851053
(31.01.80) A21d-02/38

Partely germinated grains of tye or wheat for bread baking are dried in hot air at $\leq 60^{\circ}\text{C}$ to a residual moisture content of 15-26 (18-22) wt. % After rough grinding the material is pressed through an extruder at a pressure of 50-150 bar and a temp of 140-180 $^{\circ}\text{C}$.

Method inactivates the enzymes, which are responsible for pasty bread, and gives an excellent taste and improves the nutritional value. 25.11.78 as 851053(4pp39)

FANT- D11 72063A/40 = EP ---7-350
Device for cutting sheet cakes into small pieces, e.g. petits/fours - having rotating notched cutter discs engaging cake moving on horizontal conveyor

FANTASIA CONFECTION 02.09.77-US-830195
P62 (06.02.80) *US4100-830 B26d-03/22 + B26d-01/16
D/S: E(FR)

12.7.78 as 900103 (WP 7900125)

POUP/ D11 33315B/17 = EP ---7-361
Treating and deep freezing of raised dough prods. - using instantaneous hyperfrequency heating followed by deep freezing

POUPARD M 11.10.77-FR-030599
(06.02.80) *WP7900-195 A21d-08 A21d-15/02

10.10.78 as 900150

GASH- ★ D11 09729C/06 ★ FR 2423-159
Automatic loader for charging fermented dough pieces into bakery oven - has successive conveyor bands with alternative common and independent drives

GASHOR-OOMS SA 18.04.78-ES-468917
(21.12.79) A21b-03/07

The loader is of the type which automatically transfers a predetermined number of fermented dough pieces from a prover to the oven. The loader comprises two conveyor bands arranged in succession between the prover and the oven. The first conveyor receives dough pieces from the prover and transfers them to the second conveyor. The second conveyor discharges the dough pieces into the oven.

The drive shafts of both conveyors are driven via individual free-wheel sprockets from a drive transmission common with the oven conveyor. This means that the drive to both conveyors is normally synchronised with that of the oven conveyor. Each conveyor also has an independent drive motor and transmission so that either or both conveyors may be driven faster than the synchronous speed by over-riding the free wheel sprocket clutches. 17.4.79 as 009648 (10pp448)

Volumetrically adjustable depositor esp. for dividing baker's dough - has horizontal rotary drum contg. double acting depositing piston
LOCOLAS C 20.04.78-FR-012445
R13 (21.12.79) A21c-05 G01f-11/06

The machine has a cylindrical drum which rotates beneath a feed hopper. A cavity in the drum is filled with material from the hopper. As the drum rotates and the contents of the cavity are deposited below the drum. The volume of material accepted by and delivered from the cavity is adjustable.

The drum has a diametral bore housing a double action piston with limited free movement. Displacement of the piston takes place with the bore in line with the hopper outlet. The top of the piston draws in a measured vol. of material; the bottom of the piston simultaneously discharges a similar vol. of material from the lower end of the bore.

Used partic. as an automatic dough divider but also as a volumetric depositor for pastes, powders, granules, flakes, etc. The machine is simple, robust and inexpensive. It is easily adjusted for product vol. and requires little maintenance. 20.4.78 as 012445 (7pp448)

Fluid power press for reconstituted meat partic. ham - has multiple interchangeable moulds for high output e.g. 50 units per hour

HUMBERT H 20.04.78-FR-011982
(21.12.79) A22c-17

The machine frame houses a set of fixed mould jaws and a corresp. set of opposed, mobile mould jaws. The mobile jaws are fixed to a sliding carriage which brings them up to the fixed jaws to form vertical mould passages. The tops of the passages are closed by a hinged door which is swung down into contact with the mould jaws by a fluid power cylinder. The door is locked in this position by a sliding bar displaced by a fluid power cylinder.

The contents of each mould cavity is then put under pressure by a ram driven upwards into the mould passage by a fluid power cylinder. The sliding carriage is displaced by a set of four fluid power cylinders. The carriage is pref. carried on two slides fixed to the machine frame. The carriage pref. travels along the slides for a distance not exceeding 0.61 m.

Provides a compact press using interchangeable mould jaws. The machine can be loaded very quickly. Output capacity is on an industrial scale, e.g. each press has 10 moulds, a loading time of 2 minutes and a pressing time of 10 minutes. This gives a nominal output of 400 hams per 8-hour working day. 20.4.78 as 011982 (13pp448)

Edible collagen casings by extrusion

JOHNSON & JOHNSON 16.09.68-US-759931 (27.09.67-US-670998)

A11 (A33 A97) (15.01.80) *GB1204-438 B29d-23/04 + A22c-13
Sausage casings are mfd. by extruding a collagen fibrous mass, expanded with acid, with a solid content of 3.5-5 wt.%. As the casing is formed, it is held open by NH₃ which permeates through the wall of the casing. The casing is supported by the NH₃ until the acid has been neutralised and the casing has attained its full strength.

The use of gaseous NH₃ eliminates the traditional washing, neutralising, plasticising and drying stages and also the risk of damaging the initially weak wall material during the treatment is considerably reduced. 27.9.68 as 013904 (11pp1370)

New animal feed mixts. based on carbohydrates, proteins, fats and, opt. usual additives, contain 0.1-5 wt.% fumaric acid and proteolytic enzymes in an amt. such as to give an enzymatic activity of 0.05-2.5 mTU/g.

Addn. of a combination of fumaric acid and a proteolytic enzyme gives improved feed utilization and/or improved weight gain. The feeds are partic. suitable for poultry, piglets and pigs raised for meat.

Pref. proteolytic enzymes are acid proteases active at pH 2.5-6.5, esp. microbial acid proteases, e.g. those from *Aspergillus niger* or *Rhizopus rhizopodiformis*. The proteolytic enzyme concn. should be such as to give an enzymatic activity of 0.05-2.5 (esp. 0.1-0.5) mTU/g. One TU is that enzyme concn. which releases in 1 min. under standardised conditions from a 1.2% casein soln. cleavage prods. which have the same extinction as a 1M tyrosine soln. 17.7.78 as 831306 (10pp280)

Gravimetric dispenser for ice cream container filling machine - does not pressurise prod. while empty container replaces full one

SOC PROD NESTLE SA 20.07.78-FR-021507

Q31 R13 (06.02.80) A23g-09/28 B65b-03/28 G01g-01/04

D/S: E(BE, CH, DT, GB, IT, LU, NL, OE, SW).

Two filling heads are arranged alongside each other transversely of and between container infeed and discharge conveyors. Ice-cream is dispensed continuously alternately through each of the filling heads; one head is always filling a container while the other head is closed so that a filled container can be removed and replaced with an empty one to be filled. During the filling of a container, its progressively increasing wt. is transmitted to one arm of an intermediate fulcrumed lever with adjustable counter-weight on its other arm.

The machine is used for automatic filling of ice-pail type containers with ice-cream. Typically, each container is filled with 3 to 4 kg of ice-cream. The machine fills about 1000 containers per hour. Dispensing flow does not have to be interrupted between containers. This means that the prod. is not held back under pressure. 9.6.79 as 101855 (25pp448).

Ice-cream shaper - comprises concentric inner and outer tubes to form continuous length of ice-cream coated with icing, which is extruded simultaneously

MOSC FOOD IND TECH (MORE=) 19.10.77-SU-535513
(30.05.79) A23g-09/24

Device for shaping ice-cream, comprises a body with a conical exit section. The quality of the product is improved by fitting two concentric tubes coaxially inside the body, plus a screw with a tip, the former being disposed on the outer tube and the latter on the inner. The inner tube is also provided with a heat insulator.

The mass of ice-cream at -4 to -6°C is forced into the inner space of the tube having the heat-insulator so as to shape it in the removable tip. Simultaneously, through an inlet pipe, previously-prepared icing is fed by the screw to the conical section, which where necessary, can be moved in an axial direction by screwing it in or out. This controls the thickness of the icing on the surface of the ice-cream. As a result, a continuous length of ice-cream is formed with an outer covering of icing.

Hydrolysate purification for condiment prodn. - to remove unwanted aromatic aminoacid(s), etc., by active carbon treatment, filtration and ion exchange absorption

CONSERVE FRUIT DRYI 09.08.77-SU-515832
(30.05.79) A23j-03

Method involves treatment with active carbon and subsequent removal of carbon and distilling off the vapours of the hydrochloric acid under vacuum. The content of aromatic amino-acids, sugars, furan aldehydes and sodium chloride in the hydrolysate is reduced, while at the same time increasing the product quality, by diluting with water, prior to distilling off the HCl vapours, in a ratio of 1:3 to 1:6, absorption of the hydrolysate on a cation exchange resin, and washing it with water (using 4-7 volumes of water to each volume of cationite) to separate from the hydrolysate the nitrogen-free compounds. Elution with 4-6 volumes of a 4N solution of hydrochloric acid follows.

The active carbon is used as 10-25% of the volume of hydrolysate and the distilling of the HCl is done in several stages, with the addition of 25-30% of the eluted hydrolysate at each succeeding stage.

Appts. for producing flavoured carbonated beverage - has immersed pressure chamber with permeable membrane top through which a small amt. of water enters to initiate carbon dioxide generation
PEPSICO INC 02.03.78-US-882750
(29.01.80) A23l-02/40

A beverage is carbonated using a pressure chamber immersible in the liquid base of the beverage for generating CO₂. A carbonating mixture comprising a carbonate and an acid, is located in the pressure chamber.

CO₂ is generated at a constant rate by establishing an equilibrium between the pressure of the CO₂ within the chamber and the quantity of liquid entering the chamber. The top surface of the pressure chamber is formed of a permeable membrane with a pore size of 10-100 u. A flavouring chamber is superimposed on the pressure chamber and is in liquid and gaseous contact with it. The chamber holds a flavouring substance.

The appts. produces a carbonated beverage merely by the addn. of water. It releases a carbonating gas at a constant rate over a prolonged period of time. Also any undesirable salts produced during the mfr. of the CO₂ are not dissolved in the beverage. 2.3.78 as 882750 (7pp295)

Waste water fluff filter - with rake in granular filter bed for easy backflushing regeneration

ANDERL L 17.07.78-DT-831365

F07 (31.01.80) B01d-29/08 D06f-39/10

Textile fluff and other particles are removed from waste water in laundries, textile mills and hospitals by a cylindrical vessel with a side inlet on top and a central outlet at the bottom. A filter bed of coarse granules rests on a screen plate and can be stirred by a revolving rake. The latter is driven by a common vertical shaft with a worm conveyor above the bed.

This creates a reliable filtering device for coarse impurities such as textile fluff. The filter material is easily regenerated, simply by reversing the direction of flow. Regeneration can be automated as a function of time or pressure. 17.7.78 as 831365 (8pp39)

Sewage treatment - for separate extraction of sinking, floating and suspended particles by aeration and restriction

ABEL G 22.07.78-DT-832277

(31.01.80) C02c-01/28 C02f-01/40

In a basin for the treatment of sewage, a first aeration zone, followed by inclined baffle plates, terminates in a restriction where worm conveyors for the extraction of the sinks are located. The next enlarged section houses a floating steel plate conveyor for the collection and extraction of the floats. A second restriction leads to another aerated zone with a conveyor for the extn. of the particles in suspension.

This results in the separate extraction of sinks, floats, and suspended particles which remains highly efficient even when the flow rate is greatly reduced. 22.7.78 as 832277 (14pp39)

Purification of coke oven effluent water - by driving off volatiles with heat, followed by biological clarification

DIDIER ENGINEERING 22.07.78-DT-832289

H09 (31.01.80) C02c-05 C02f-03/12 C10b-39 C10b-53/08

Effluent water from coke ovens is purified by (1) thermal treatment in a stripper zone to remove volatiles (NH₃, H₂S, HCN), followed by (2) biological clarification to remove organic contaminants. The process is economical and efficient, removal of volatiles allowing attachment by bacteria in a largely self-regulating process.

Pref. the incoming water is heated in exchange with water from the stripper stage. NaOH is added to bind the fixed NH₄ salts, and reduce the acidity. Before stage (2) Fe salts and/or phosphoric acid or its salts, and/or MgSO₄ or H₂SO₄ are added to remove traces of H₂S and HCN, and assist flocculation in stage (2), which is pref. a sludge freshening process carried out in two stages. Oxygen is supplied by surface aeration. 22.7.78 as 832289 (10pp195)

J01 (06.02.80) *GB1541-601 + C02f-01/46

D/S: E(BE, CH, DT, FR, LU, NL, SW).

A process is claimed for removing dispersed soluble or resuspended contaminants from a polar liq. such as water, many of the suspended particles being characterised by Van der Waals effect and being a solid under ambient conditions. About 0.1 wt.% randomly moving particulate matter is dispersed in the liq. medium, the particulate matter being added or formed by fractionation of the contaminant when it is initially present in bulk. The dispersed particles have a density of 1.05-2.0 and a size of 30-225 μ with a free surface energy of < 100-500 ergs/cm². Any additional solid matter present is also reduced to this particle size.

An oxidn. medium is provided by acidifying the liq., dispersing gaseous O₂ in it, and providing a supply of free electrons e.g. by acidic dissociation of the polar liq. and by in-situ oxidn. of a heavy metal which is capable of subsequently forming a flocculant ppte. in alkaline media, so that a charge is imparted to the moving particles by random distribution and attachment of the electrons to these. The charge on the moving particles is maintained and coagulation and phase sepn. of the particles and solid contaminants is restrained during successive oxidative reaction periods by agitation effected at least partially by flowing the liq. through electrically insulated flow-connected reaction vessels in intimate mixt. with gaseous O₂, at a variable flow rate defined by dimensionless parameters derived from the internal size and shape of the respective vessels and their connecting leads. The liq. is then made alkaline, agitation is stopped and the liq. is electrically earthed to flocculate the heavy metal and to mutually ppte the charged particles, the metal ions and soluble contaminants, leaving an O₂-contg. supernatant liq.

D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, OE, SW).

A device for a controlled metering of liquid media, for example sulphuric acid for the drying of gases on the surface of the packing in a tower or the manufacture of hypochlorite from chlorine gas and caustic soda solution, consists of a horizontal manifold in which short branch pipes are welded in the bottom, to protrude inside where they have one or two side holes. Hoses of different length are attached to the branch pipe ends below the manifold.

The different length of the hoses ensures that their outlets end at different depths of a fluid medium so that a uniform distribution is ensured. By letting the fluid in the manifold overflow into the top ends of the branch pipes a greater flow rate for the additive can be achieved.

Excess growth control system for fluidised bed reactor - includes a separator column extending into the bed and an agitator for shearing excess material

ECOLITROL INC 06.07.79-US-055149 (19.07.78-US-926207)

(06.02.80) B01j-08/20 C02f-03

D/S: E(BE, CH, DT, FR, GB, IT, NL, OE, SW).

A control system for preventing accumulation of excessive cellular material in a fluidised bed reactor includes a separator column within an effluent head above the bed. The column has a draw-off port below the surface of the effluent head. An agitator arrangement is associated with the column to effect shearing of the excess cellular material from the particles of the bed to produce a mixt. of sheared material and partially stripped carrier particles. The sheared material is discharged through the draw-off port.

The process is used in the removal of N cpds., such as nitrate or ammonia, from waste water using a fluidised bed of solid particles serving as carriers for micro-organisms. As the head of effluent is developed above the bed, the clarified effluent is discharged from the reactor through a clear-effluent port. Confinement of the shear growth to the column before drawing off means that no growth material enters the process effluent stream and the use of a clarifier in the output line of the reactor is eliminated.

19.7.79 as 301440 (48pp1044).

D/S: E(BE, CH, DT, FR, GB, IT, LU, NL, OE, SW).

The treating installation comprises a reaction chamber which produces a helical flow of hot gas which is held away from the wall of the reaction chamber. The chamber is designed for the combustion of axially injected fuel, such as methane, supported by air which passes into the chamber via an annular jacket surrounding the combustion space.

The outlet of the reaction chamber converges to speed the helical stream of hot gas through a Venturi throat which leads to the divergent entry of a contacting chamber.

Liq. to be treated is injected into the whirlpool axial depression just inside the contacting chamber. The vol. of gas passing through the Venturi throat should be ≥ 100 times the vol. of axially supplied fuel and ≥ 100 (pref. 1000-10,000) times the vol. of liq. to be treated.

For treating waste water the temp. in the throat is pref. 900-1200°C and the contacting chamber outlet temp. is 350-500°C.

The appts. is used for treatment of waste water (partic. with solids content of 20% to 30%), for concn. of mineral acids (such as phosphoric or sulphuric acid), for evaporative drying of aq. suspensions and emulsions, and for concn. of solutions.

Carbonating vessel for drinks dispenser - with cooling coil beneath perforated baffle and carbonated water outlet beneath baffle

BRIT SYPHON IND LTD 12.03.76-GB-010072
(06.02.80) B01f-03/04 C02d-01/04

A carbonator comprises a sealed vessel supplied with gas to carbonate water passing through the vessel. A coil supplied with a refrigerant is located within the lower portion of the vessel to cool the water.

Pref. a perforated baffle is located above the coil to prevent incoming water from disturbing cool water beneath the baffle. Carbonated water is withdrawn from beneath the baffle. The coil may be cooled or cold water or a refrigerant from an external heat exchanging tank.

The appts. carbonates and cools water and is used e.g. for dispersing soft drinks. 8.3.77 (5pp295).

WESS- ★ D15 09812C/06 ★ GB 2026-461
Sewage treatment by activated sludge process - with gas used to strip carbon dioxide from returned activated sludge

WESSEX WATER AUTHOR 19.07.78-GB-030315
(06.02.80) C02f-03/12

A sewage treatment process includes a stage in which sett-

led sewage is mixed with oxygen and returned activated sludge. A gas is used to strip CO_2 from the returned activated sludge. The gas may be either air, nitrogen or a nitrogen containing gas and in a preferred embodiment is the exhaust gas from a pressure swing absorption unit used to provide the oxygen.

The process uses an oxygen activated sludge process for treating sewage. By stripping CO_2 from the activated sludge, its pH is caused to rise which leads to an increase in nitrification in the reactor. 19.7.78 as 030315 (5pp295).

Cyanide-contg. waste water treatment - by neutralisation, reaction with an aromatic amine and filtration

KANZAKI PAPER MFG KK 13.06.78-JA-071819

E19 (24.12.79) C01c-03 C02c-05/02

The pH of a waste soln. contg. cyanide is brought to 7.9, and an equiv. molecular amt. w.r.t. cyanide of a cpd. of formula (I) is added.

R_1 or R_2 is H, 1-18C alkyl opt. substit. by cyano or halogen, 2-8C alkoxy, benzyl or phenyl. R_3 is H, nitro, 1-4C alkyl or 1-4C alkoxy. Z is 1-8C alkyl $\geq$ 18C alkenyl a opt. substit. phenyl- (1-4C)-alkyl, or an opt. substit.

heterocyclic gp. X is an halogen, phosphate, sulfonate or citrate, anion.

In an example, 100ml of an aq. soln. contg. 1.6% of (II) was stirred

with 100 ml. of waste water of pH 7 contg. 0.1% of cyanide ion for 2 hours. The stirred soln. was filtered to obtain a soln. contg. no cyanide ion.

13.6.78 as 071819(3pp51).

JAOR ★ D15 10129C/06 ★ J5 4162-680
Regeneration of complex bed-type ion exchange appts. - used for purifying water, by passing regenerating agent from bottom to top of ion-exchange resin bed, then from top to bottom

JAPAN ORGANO KK 15.06.78-JA-071462

J01 (24.12.79) B01j-01/09

The method comprises positioning two distributors at upper and lower ends of an ion exchanging tower and a collector at a central portion of it. Appts. has a strongly electrolytic ion exchanging resin bed as a lower bed, a weakly electrolytic ion exchanging resin bed as a central bed, and a weakly electrolytic ion exchanging bed as an upper bed.

The improvement comprises passing a regenerating agent through a distributor from the lower bed to the upper bed to remove it from the collector and regenerate the bed below the collector, and passing a regenerating agent through another distributor from the upper bed to the lower bed to remove it from the collector and regenerate the bed higher than the collector. A siphon tube is connected to the collector and the water surface of the tower is supported at the same level as the siphon head by opening a valve of the siphon tube. 15.6.78 as 071462(7pp51).

EBAI ★ D15 10131C/06 ★ J5 4162-683
Desalination of water contg. silica - involves using specified permeable membrane, treating with alkali and passing through second membrane

EBARA INFILCO KK 14.06.78-JA-070954

A88 J01 (24.12.79) B01d-13

An aq. soln. contg. 20-60 mg/l of SiO_2 , such as sea water, river water, underground water, or waste water is treated with a permeable membrane to obtain desalted water and conc. water. The aq. soln. is passed through the permeable membrane to obtain a conc. soln. contg. a nearly satd. conc. of SiO_2 and a desalted soln.. The pH of the conc. soln. is adjusted > 9.0 , and the soln. is then passed through an another permeable membrane to obtain a desalted soln. contg. no SiO_2 .

The membrane is made from acetylcellulose, aromatic polyamide, polysulphone, acrylonitrile, polyolefine, graphite, or inorganic hydroxide or oxide.

In concentrating an aq. soln. contg. SiO_2 by using a permeable membrane up to a high concn., there is the disadvantage that SiO_2 is deposited on the surface of the membrane. In the present method, since alkali is added to the concn. soln. obtd. in the first process to convert SiO_2 into a soluble form, SiO_2 is not deposited on the membrane in the second process. 14.6.78 as 070954(2pp51).

NISN ★ D15 10221C/06 ★ J5 4162-845
Effluent treatment to remove oils or suspended matter - by adding a water soluble metal salt, adjusting to weakly alkaline pH and passing through a polymeric membrane

NISSHIN SPINNING KK 15.06.78-JA-071484

A97 (24.12.79) B01d-13 B01d-31 C02c-05/02

Emulsified oil-contg. effluent or suspended effluent contg. organic or inorganic solids is effectively purified by adding a water-soluble metal salt, followed by adding alkali to adjust the pH to weakly alkaline pref. to about 9 and to form a metal hydroxide which is flocculated with the solids or the organic matter contained in the effluent opt. in the presence of polymeric coagulant, and passing it through fine porous membrane of pore dia. $< 5 \mu\text{m}$. to remove flocs resulted. This process is pref. carried-out even the size and density of the flocs are uneven.

The salt is e.g. FeCl_3 , $\text{Fe}_2(\text{SO}_4)_3$, AlCl_3 or Al sulphate. The alkali is e.g. NaOH or $\text{Ca}(\text{OH})_2$. The membrane is e.g. made of cellulose acetate, nitrocellulose, polyamide, polyacrylonitrile, polyvinylchloride, polyethylene, polystyrene or polymethylmethacrylate. 15.6.78 as 071484 (3pp34).

HAYA/ ★ D15 10222C/06 ★ J5 4162-847
Treating polluted water without using special deodorising appts. - by adding aq. sodium carbonate contg. an oxygen donor e.g. percarbonate, and an acid

HAYATA C 14.06.78-JA-071602

(24.12.79) C02c-05/04

Polluted water is purified, decolourised and deodorised without using any deodorising appts. by adding an aq. soln. of Na_2CO_3 contg. an oxygen-donor, e.g. sodium percarbonate etc. together with acid, e.g. HNO_3 and H_2SO_4 etc., if necessary in combination with dichlorobenzene.

In the case of esp. treating polluted water contg. cattle excrement or stored in pit vessel in dust-incinerating station, the addition of the acid is effected before addn. of the aq. soln. contg. Na_2CO_3 and the oxygen donor, otherwise deodorisation becomes impossible. Organic matters contained in the polluted water are pptd. by flocculation in combination with dye-stuff, thereby BOD value of water to be outflowed is maintained always < 5.0 , and contamination of underground water is effectively prevented. 14.6.78 as 071602(9pp34).

Reusing copper plating process washing water - involves adjusting pH to at least 3 and passing in turn through cation and anion exchange resin

HITACHI KK 16.06.78-JA-072144

M13 (26.12.79) C02c-05/08 C23c-03 C25d-21/22

Process comprises first adjusting the pH of the washing water to a pH of ≥ 3.0 and passing in turn through a cation and an anion exchange resin so that the water is regenerated. Water is used until the concn. of heavy metal ions becomes too great. The metal ions adsorbed on the cation exchange resin are extracted by an inorganic acid to regenerate the resin and the pH level of the extracted liq. is adjusted. The Cu complex ions adsorbed on the anion exchange resin are extracted by an alkaline soln. to regenerate the resin. Finally the extracted liq. produced is utilised as a chemical Cu plating liq.

The Cu and the complexing agent contained in the anion exchange resin regeneration liq. can be easily recovered and reutilised. 16.6.78 as 072144(4pp7).

ASAH ★ D15 10366C/06 ★ J5 4163-904
Treating oil emulsion opt. contg. surfactant - by passing through porous resin membrane to give permeated liq. of high oil conc.

ASAHI CHEMICAL IND KK 13.06.78-JA-070306

A88 H07 J01 (27.12.79) C02c-05 C10g-33

An emulsion consisting of x pt. vol. oil and y pts. vol. other than oil, and opt. contg. z mol/l surfactant is used as the liquid to be treated. Compsn. of the emulsion is defined by the following equations; (1) $z = 0$, when $0.02 \leq \alpha < 0.5$; (2) $0 \leq z \leq 1.78 \times 10^{-3} \alpha - 8.9 \times 10^{-4}$, when $0.5 \leq \alpha < 0.8$; and (3) $0 \leq z \leq 1 \times 10^{-1}$, when $0.8 \leq \alpha < 1.0$, (where $\alpha = x/(x+y)$).

The liq. is passed through a porous membrane prepd. from a resin having $< 35 \text{ dyn/cm}$ critical surface tension at the surface of the raw material and a combination of

such resins, and having an average pore radius $r(\mu\text{m})$ satisfying the inequality $2 < r/r_E \leq 100$ (where in r_E is the average particle radius of the emulsion), and a thickness $d(\mu\text{m})$ satisfying the following inequality: $5 \leq d/\beta \leq 5 \times 10^2$, (where $\beta = r^2/r_E$). Thus, permeated liq. contg. $> x$ pt. by vol. oil is obtd.

Pref. the distribution of the pore size of the porous membrane $\bar{r}_4/\bar{r}_3$ is < 1.5 in which $\bar{r}_3 = \int r^3 N(r) dr / \int r^2 N(r) dr$, and $\bar{r}_4 = \int r^4 N(r) dr / \int r^3 N(r) dr$, $N(r)$ is a distribution function of the pore radius, and the number of the pore having $r-(r+dr)$ pore radius is given by $N(r)dr$; r and $N(r)$ are determined from the result of the electron microscopic analysis.

An emulsion consisting of an oil and a liq. other than oil is allowed to pass through a porous membrane to obtain a permeated liq. having high concn. of the oil.

Pref. resin for the porous membrane fluorine contg. resin, polyethylene, polypropylene, polystyrene, natural rubber, butyl rubber, neoprene, synthetic rubber such as nitrile rubber, polymethyl siloxane, polymethyl methacrylate, etc., or combinations of such resins such as butadiene-styrene copolymer, silicone-polycarbonate copolymer etc. 13.6.78 as 070306(9pp126).

MIYA/ ★ D15 10455C/06 ★ J5 4164-343
Treating waste water sludge - by coagulation and filtration dewatering, with addn. of hydrogen peroxide prior to coagulation

MIYANO K 16.06.78-JA-072961

(27.12.79) C02c-03

In the treatment of organic sludge resulting from the treatment of waste water e.g. sewage by coagulation and filtration dewatering, the improvement comprises adding H_2O_2 prior to coagulation so that generation of unpleasant odours, from the sludge and dewatered filter cake is effectively prevented.

Pref. 10-15% aq. H_2O_2 soln. is added to the sludge in amt. of a few hundred ppm prior to addn. of polymer coagulant to the sludge in a flocculating tank, followed by reacting together for a certain period, so that the odour of the sludge is almost completely extinguished and simultaneously sterilisation of colon bacilli etc. is accelerated. 16.6.78 as 072961(3pp34).

NISH- ★ D15 10456C/06 ★ J5 4164-344
Treatment of sewage sludge, waste water etc. - by adding calcium hydroxide and hydrogen peroxide

NISHIHARA KANKYO EI 16.06.78-JA-073509

(27.12.79) C02c-03

A sludge resulting from treatment of sewage, high soil and industrial waste waters, etc. is effectively dewatered by adding a mixt. of $\text{Ca}(\text{OH})_2$ and H_2O_2 , followed by thorough agitation, and subsequently subjecting to dewatering, e.g. vacuum filtration, centrifugation etc.

Granules of the sludge are in contact with nascent oxygen formed by decompsn. of H_2O_2 and $\text{Ca}(\text{OH})_2$ etc. and oxidised to granules easily separable from aq. phase. The oxidising strength of H_2O_2 is increased because the system becomes alkaline due to $\text{Ca}(\text{OH})_2$.

Further $\text{Ca}(\text{OH})_2$ exhibits coagulation effect, thereby the sludge granules are easily flocculated. In a modification an iron salt, e.g. Fe chloride and Fe sulphate etc. may be used in combination with the mixt. comprising $\text{Ca}(\text{OH})_2$ and H_2O_2 to further accelerate the oxidn. of the sludge by its catalytic activity. 16.6.78 as 073509(3pp34).

Desalination of solutions by reverse osmosis - includes dividing supply into two streams at different pressure using flow work exchangers

STEINMULLER L & C GMBH 21.06.79-DT-924971 (14.07.78-DT-830987)

J01 (16.01.80) B01d-13 C02f-01/44

The concentrate under pressure leaving a plant for the sepn. of salts from a soln. by reverse osmosis, is fed to a chamber or into one end of a double reservoir assembly; the reservoirs being spheroid, ellipsoid or double-conical rotation bodies. These have geometrically similar sepg. membranes or are membraneless pressure vessels, with or without fillings or inbuilt structures. At the same time a vol. of soln. from the other end of the double reservoir goes to a pump. This compresses the vol. of soln. to the input pressure by overcoming a relatively small difference between its pressure and that of the reverse osmosis plant.

Parallel to this operation, the salt soln. to be sepd. flows into a corresp. chamber section of a second or further similar membrane double reservoir, so that from its other side practically pressureless concentrate is drained. This is the concentrate which is fed into this other chamber in the previous one of the corresp. operational phases under pressure and with the corresp. transporting energy.

Used for the prodn. of drinking and/or industrial water from brackish or seawater. The process, using conventional pumps without detenting machines for the concentrate, makes considerable savings of energy possible. 13.7.79 as 005489 (22pp1014)

Double reservoir for energy recovery in water technology - has membranes dimensioned and secured to prevent their damage

STEINMULLER L & C GMBH 21.06.79-DT-925025 (14.07.78-DT-830982)

J08 (16.01.80) B01d-13

Vessels which are symmetrical to an axis of rotation are used for the storage separately of two volumes of fluid, which are functionally dependent upon each other. The vessels are pref. divided across the middle by membranes fixed to the container walls, so that each container has two similar chambers which are variable in volume. The geometrical layout of the vessels and the membranes are such that in the outermost position, the membranes lie closely against the container wall, whilst in all intermediate positions they float freely.

Used for the recovery of energy from concentrates obtained under high pressure in reverse osmosis plants and wet oxidn. installations for the treatment of sewage. The double reservoirs are operated cyclically in parallel and the part flow of soln. is fed into the reverse osmosis installation backed up by the highly pressurised concentrate, and using a high pressure pump to make up the slight difference in pressure. 13.7.79 as 005490 (18pp1014)

Restoring activity of carbon used for purification of alcohol - includes treatment with steam and mixt. of air with ozone

VORON TECHNOL INST (MOLI=) 13.04.78-SU-597001

E36 (30.05.79) B01d-15/06 C12h-01/04

The activity of carbon used for purification of alcohol-water mixts. can be restored by first extracting from it alcohol and impurities by passing satd. steam through it, cooling with a compressed air stream; heating with steam; and cooling again.

This method is improved by blowing, after the first cooling, a mixt. of 99.8-99.9 wt. % of air and 0.1-0.2 wt. % of ozone at 20-30°C for 40-50 min. Then the carbon is heated with steam at 350-400°C for 40-50 min.

By this method, the sorptional and catalytic activity of the carbon is increased; the consumption of carbon is reduced; its service life is extended from 1-3 to 5-6 years. The loss of alcohol is reduced.

Uniform regeneration of cation exchanger - by treating part with acid soln. and remainder with sodium chloride soln. before washing with water and stirring by compressed air

ATOM POWER ENG INST 13.12.76-SU-428615

J01 (30.05.79) B01d-15/04

Regeneration of cationic exchanger at compatible H-Na and NH₄-Na-cationisation of water is based on sepg. the cation exchanger into 2 parts (ratio 1:1-5). The first part is treated with 2-5% aq. acid soln. The second part is treated with 4-8% aq. NaCl soln. After washing with water the layers are mixed by compressed air.

In an example, water contg. (in mg. eq./l): overall hardness 2.4; carbonate 1.7; Na 0.3; is passed through sulphonated coal SK-1 at 15 m/hr.

For regeneration, the cation exchanger is split into 2 equal pts. by volume. One part is treated with 5% HCl (expenditure 36.6 g/g. eq.) and the second by 8% NaCl (expenditure 110 g/g. eq.). The regeneration rate is 5 m/hr. After washing with ionised water, the layers are mixed by compressed air. This gives filtrate of compsn. (mg. eq/l): hardness 10; alkalinity 0.5.

S-contg. cpds. can be removed from aq. waste obtd. in the prodn. of paper, petroleum products and gas by absorption on a polymeric quinone. The process gives as good results as the use of activated carbon or alumina. The method is simpler, since the quinones are non-toxic and insoluble in water, and the process can be operated continuously or in batches by a normal filtration method. Polymer with an oxidn. redn. capacity of 8-9 mg. eq/g. is washed with distilled water before the waste is passed through it, and the redn. in the content of SH groups is followed by amperometry. The disulphide groups present are reduced by addn. of satd. Na₂SO₃ soln. to the waste before treatment, so that only SH groups are left in soln.

Aerator for water purificn. system - with perforated ejector feeding sec. air into foam-forming chambers provided by blades compensating pump torque

BREST ENG CONS INST 16.01.78-SU-569117

(30.05.79) C02c-01/10

The aerator comprises a guide tube with an annular diffuser and housing a screw pump.

To increase output and reduce power consumption at the diffuser output, there are in series an annular ejector and chambers formed by blades bent contrary to the direction of rotation of the pump.

The ejector wall is perforated. The electric motor, via the pump, drives the liquid through the diffuser with radial outflow, the secondary air from the holes in the ejector wall being dispersed in the individual chambers through collision of the gas-liquid mixture on the blades. The resulting emulsion issues on to the surface of the liquid, and also entrains air from the atmos. With the blades also compensating the pump torque, efficiency is increased by a factor of 1.5-2.

D/S: E(DT, FR, GB, OE).

A process for chemical and biochemical reactions in the liquid or gas/liquid phase takes place in a first section of a reactor which has a loop characteristics of adjustable recirculation, and with large heat transmission surfaces, and then in a second reaction section which has a tube characteristic.

In the case of styrene polymerisation, good mixing in the loop part is followed by low reaction rate without back mixing in the tube part, resulting in a uniform high-polymer product. In a gas-liquid system for the production of biomass (single cell protein), it combines the recirculation of the liquid phase in the loop part with the better recirculation of the gas in the tube part.

Reagent for hydrogen peroxide assay - contains N,N-di:subst. aniline as hydrogen donor in colour forming reaction, e.g. for cholesterol assay

KYOWA HAKKO KOGYO 01.08.78-JA-093835

B04 E36 J04 R16 (06.02.80) C12q-01/26 G01n-21/31 G01n-31/22 G01n-33/52

D/S: E(DT, FR, GB).

A colorimetric reagent for assaying H_2O_2 in samples contains a peroxidase, H-donor (A) and an electron- or radical-acceptor (B), (A) and (B) reacting in presence of H_2O_2 and peroxidase to form a pigment. The new feature is than a subst. aniline of formula (I) is used as (A):

($\text{R}_1 = \text{CH}_3, \text{C}_2\text{H}_5, \text{CH}_2\text{OH}, \text{CH}_2\text{CH}_2\text{OH}, \text{CH}_2\text{CH}_2\text{NH}_2$ or COCH_3 ;

$\text{R}_2 = (\text{CH}_2)_n\text{Z}, \text{CH}_2\text{CH}_2\text{NH}_2$ or COCH_3 ;

$\text{Z} = \text{OH}$ or acetyl amino;

$n = 1$ or 2 ;

R_3 and $\text{R}_4 = \text{H}$ or CH_3 ; R_3

can also be C_2H_5 or OCH_3).

Suitable (B) are 4-aminoantipyrine, 2-thiophene carboxylic acid hydrazide, benzidine or 3-methyl-2-benzothiazolinone hydrazone. The mixt. may also include an oxidase (esp. cholesterol, choline or glucose oxidases or uricase) to generate H_2O_2 quantitatively in situ from a precursor.

The reagent is used in clinical assay of cholesterol, phospholipids, glucose and uric acid. Pigments formed have higher absorbance and stability and are less subject to interference by bilirubin or vitamin C than those from known chromogens such as phenol or dimethylaniline.

3-Keto-steroid-5-ene isomerase enzymatic markers - allow determination of low concentrations of hypophysial-hormones, plasmatic steroid etc., e.g. placental lactogenic hormone, progesterone

INST NAT SANTE RECH MED 02.08.78-FR-022867

B04 (06.02.80) C12q-01

D/S: E(BE, CH, DT, GB, IT, LU, NL, OE, SW).

Use of Δ^5 -3-keto-steroid isomerase (I) as an enzymatic marker in immunoenzymatic determination is new. The enzymatic activity, which is proportional to the concentration of the substance to be determined, is determined by measuring the absorption in UV light at 248nm.

The immunoenzymatic determination does not have the restrictions which must be exercised with radio-immunological determinations and may be used to determine substances present in very low concentrations in body fluids. The analysis may be automated using existing apparatus, e.g. that used for radio-immunological determinations. The enzyme (I) reacts with the antigen or antibody in a selective manner with high yields, and it is not necessary to insolubilise the antigen or antibody prior to determination. Typical determinations are those of hypophysial hormones, plasmatic steroids and other protein-type cpds. e.g. determination of placental lactogenic hormone (PLH) and progesterone.

Microorganism cultivation control in live vaccine production - by regulating redox potential according to living organism concentration increment and concentration ratio
PIMENOV B I 04.02.77-SU-452162
(25.05.79) C12b-01/08

Earlier microorganism cultivation control system measured the dissolved oxygen and regulated the pH of the medium, mixer r.p.m., nutrient medium feed rates and aeration. Now, for greater accuracy, these factors and also the redox potential are regulated with regard to any increment of the living organism concentration and the ratio of this concentration to the biomass concentration. The method is useful esp. in producing live vaccines, and also in e.g. the foodstuffs ind.

Microorganism cultivation control in nutrient yeast prodn. - by correcting food supply to equipment according to ratio of change in substrate utilisation factor to change in feed rate
KIEV AUTOMATION INS 19.12.77-SU-557369
(25.05.79) C12b-01/08

Known microorganism cultivation control in a system with several parallel-operation equipments varies the supply of the food substances. In order to increase the end-product yield, the food supply to each equipment is corrected, according to the ratio of the change of a substrate utilisation factor to the change in the food supply rate for each equipment.

The proposed method is useful in controlled continuous cultivation e.g., of nutrient yeast in the microbiological industry.

Boboshko, V.I., Kozanevich, Z.Ya., Fedorov, A.S. et al. Bul. 18/15.5.79. 19.12.77. as 557369 (3pp840)

HYDR=★ D16 10628C/06 ★SU-663-712
Nutrient medium for cultivation of microorganisms, e.g. fodder yeasts - contg. mono:saccharide, organic acids, inorganic cpds. and yeast autolysate for increased yields

HYDROLYSIS IND ASSO 22.12.77-SU-558437
C03 (D13) (28.05.79) C12b-03/12

Nutrient medium for cultivation of microorganisms, esp. fodder yeasts, contg. a monosaccharide, acetic acid, ammonia, H₃PO₄, KCl and MgSO₄ is improved by addn. of formic acid, succinic acid and a yeast autolysate, whereby the yield of the biomass is increased, and the process is accelerated.

The compsn. contains (in vol. %) a monosaccharide 0.5-1.0, CH₃COOH 0.2-0.3, HCOOH 0.1-0.2, C₄H₆O₄ 0.2-0.3, H₃PO₄ 0.02-0.04, KCl 0.02-0.04, MgSO₄ 0.01-0.02, NH₃ 0.25-0.35, yeast autolysate 0.2-0.3; the balance is water.

The above additives facilitate assimilation of various organic substances, e.g. pentose, present in industrial liquids used as nutrient media for yeasts. In examples, the yield of Candida Scottii was 4.5g/l. over 4.5h. (control 4.2 g/l over 5h); the yield of Trichosporan cuteneum was 5.8 g/l. over 5h. (control 5.0 g/l. over 515 h.). Continuous cultivation of yeasts *Saccharomyces cerevisiae* - in two stages with partial utilisation of metabolism products in second stage to increase yield and reduce contamination of effluents

AS USSR MICROB PHYS 11.01.77-SU-445059

(28.05.79) C12c-11/18

Yeasts are cultivated continuously, by a two-stage process, in a nutrient medium contg. sources of carbon and nitrogen, mineral salts and biostimulators, with aeration; using in the first stage glucose as a carbon source, and in the second stage the culture liquid from the first stage.

This method is improved by using in both stages yeasts *Saccharomyces cerevisiae*, and directing the first stage in such a manner that the flow rate is 0.05-0.4 h⁻¹ and its ratio to the second stage flow rate is 4:1 to 7:1. In this way the biomass yield is increased and the concn. of the metabolism products in the aq. effluents is lowered (as they are partly utilised in the second stage).

Proteolytic enzyme hygrolytin for use in medicine - produced by cultivating *Actinomyces hygroscopicus* in nutrient medium

MEDICAL ENZYME ANTI 02.08.76-SU-389331

B04 (30.05.79) C12d-09/14 C12d-13/10

Proteolytic enzyme hygrolytin, for use in medicine, is produced by cultivating e.g. *Actinomyces hygroscopicus* in a nutrient medium; sepg. the mycelium and calcium ions; effecting adsorption of the simultaneously produced enzyme hygrolycin on a carboxylic cationite; salting out the hygrolytin with (NH₄)₂SO₄; reprecipitating the hygrolytin; treating it with activated carbon and drying.

This method is improved by carrying out the cultivation of *Actinomyces hygroscopicus* at 31-33°C for 72-108h; performing the salting out of the enzyme (pref. in presence of 0.5-1 vol. % of CaCl₂) after the sepn. of the mycelium; removing the impurities with the equivalent quantity of cellulose and NH₄Al(SO₄)₂ at pH 4.8-5.0; and removing the hygrolycin immediately before the lyophilic drying of the preparation.

By this method the biosynthesis in this system is directed in such a manner that the process is accelerated and the yield and quality of the product is improved. The yield of hygrolytin is 30% w.r.t. the culture liquid; the activity of the preparation is 3-5 units/ml.

Changing colour and flavour of wine - by passing wine through layer of oak or beach shavings activated by successive treatment with alkali and acid

FOOD IND CORR COLL 27.01.78-SU-574383

(30.05.79) C12g-01/02

Colour of wine can be changed e.g., from rosy to pale straw, and flavour improved by passing the wine through a layer of wood shavings (oak or beach) having a width of 5-40 mm. and a thickness of 0.5-3.0 mm.

The wood shavings are preliminarily activated by a treatment with 0.5% soln. of calcined soda at 85-86°C, repeated 3-4 times over 24-25h. This is followed by rinsing with hot water. Then the shavings are treated with a 2% H₂SO₄ soln. for 24-25h; the treatment is followed by washing with cold water.

The above treatment results in reduction of the optical density of wine (to 0.14 at 434 mμ) and of the phenols content (to 210 mg/l). The type and aroma of the wine is unchanged. The taste is improved.

Bacillus thuringiensis insecticide prodn. - without premature cell lysis by maintaining pH of 6.3 to 7 and/or applying anaerobic conditions during cultivation

CIA DI RICERCHE CHIM SA 07.05.76-DT-620317

C03 (25.05.79) *DT2620-317 A01n-15

Bacterial insecticide is produced by the submerged cultivation of *Bacillus thuringiensis* and carrying out a part of the cultivation process under anaerobic conditions, and purifying the preparation by dialysis, whereby a premature lysis of the bacilli is prevented.

The aeration of the nutrient medium is stopped 12h. after the beginning of the cultivation, and the anaerobic conditions are maintained for 4-6 h. The cultivation is carried out at pH 6.3-7 until spores are formed. The water-soluble exotoxins are removed by dialysis through a semipermeable membrane, e.g. a colloidal membrane. The product freed from exotoxins is dried by mixing the spores and crystals with bentonite and heating at 40-45°C or spray-drying.

The preparation has high activity, and large concn. of spores and endotoxin; β -exotoxin is absent.

The crosslinks obtd. using reagents (i) are broken with difficulty, those with reagents (ii) are cleaved more easily. A 5% aq. soln. of these derivs. after boiling with maleic acid buffer (pH 6.1), exhibits a Brookfield viscosity 40-20,000 mPa.s. Prepn. of these derivs. comprises treatment of starch with reagents (i), followed by further cross-linking with reagents (ii). The prods. are used as thickening agents, esp. in foods and nutrients. 7.9.73 as 345341 (10pp047)

SELW- D17 87781B/49 =EP ---7-419
Preliminary liming plant for raw sugar beet juice - stands vertically and recirculates part flow to ensure uniform alkalinity

SELWIG & LANGE MASC 29.07.78-DT-833348

(06.02.80) *DS2833-348 C13d-03/02 + B01f-07/18

D/S: E(BE, FR, GB, IT, NL).

A vertical liming tank for sugarbeet juice is subdivided by horizontal plates into eight chambers through which the juice ascends in a zigzag flow while the milk of lime is added at the top. L-shaped tubes which link successive pairs of chambers have an adjustable top inlet at the higher and an outlet at the horizontal leg at the bottom of the lower of the pair of chambers so that a side stream can circulate.

The adjustable side stream circulation results in more efficient mixing of the juice in the pairs of chambers and in the achievement of more exact pH-values in them.

13.6.79 as 101919.(15pp39).

Horizontal drum for countercurrent contacting of liq. and solid - esp. for sugar extn. has passages for improved liq. distribution

SOC SUCRIERE CONSEI (FIVE) 18.07.78-FR-021221

(06.02.80) B01d-11/02 C13d-01/10

D/S: E(BE, CH, DT, GB, IT, NL, OE).

The drum is partitioned into a number of compartments. In each compartment, drum rotation first mixes the solid and liq. phases and then separates the liq. for transfer to

the next compartment. Sepn. is effected by perforated buckets which raise solids to move them axially in one direction while liq. drains to be moved in the opposite direction.

Liq. entering each compartment first encounters a plate which has an opening by which the liq. enters an elongated pocket fixed to the edges of the opening. Each pocket is perforated and carries liq. right into the solid phase in the compartment, following a path roughly parallel to the axis of the drum. The sheet and pocket can be perforated over the whole or part only of their surface areas. Deflector baffles can be fitted in each compartment to intensify contacting.

The drum is used in industrial contacting of solid and liq. phases for washing, extn. etc., esp. for refinery sugar extn. Increased homogeneity of contacting and improved prod. yield are obtd.

16.7.79 as 400504 (13pp448).

Cellulosic materials decomposing percolator - having annular filter spaced within upright vessel

EICKMEYER R 17.10.67-DT-567335

A11 F09 (A71) (15.01.80) *BE-722-397 C13k-01/02 + D21c-03/04

Cellulose material is chemically digested in a percolator whose bottom portion is conical in shape and has inside a conical sieve plate of the same angle spaced from the wall forming a cavity sealed at the top and bottom by rings. The cavity is connected to the exterior by inlet and outlet pipes ending in cylindrical portions which are cap-sealed. A filler head and sealable conduits are provided, together with a steam release valve, for simultaneous feeding of liq. and steam to the cellulosic material.

Before the percolator is charged with cellulosic material, the required amt. of reactant liq. of desired chemical concn. and at < b.pt. is fed in above the conical portion in which the pressure is atomospheric or slightly above. Simultaneously high pressure steam is fed in under the sieve plate in amt. that the mixing temp. of the liq. above the sieve plate is raised to >b.pt. so that air or other non-condensable gases in the percolator are flushed out via the steam valve in the cap. Thereafter steam is fed in through the cap at ca. 1 atmos., and the liq. not absorbed by the cellulosic material is forced through the sieve plate into the bottom portion of the cone. The cellulosic material is maintained at a fixed temp. by steam passed through the sieve plate, by regulating the steam feed from beneath during the reaction period. 17.10.68 as 014849 (8pp913)

Cosmetic compsns. having good feel and perfume holding properties - contain metal silicate, carbonate, tungstate, oxide or hydroxide in form of fine globular substance

POLA KASEI KOGYO KK 16.06.78-JA-072916
E37 (26.12.79) A61k-07

Cosmetics contg. hollow porous fine globular substance of 1-40 μ dia. selected from metal silicate, carbonate, tungstate, oxide and hydroxide.

Specifically the fine globules have average dia. 3-20 μ, true specific gravity 1.20-1.70 g/cm³, wall thickness 0.16-10 μ and pores of 10-160 Å dia.

The fine globular substances show excellent rolling effect and they give good touch, perfume-holding property, humidity-holding property, hygroscopic property, transparency, gas-permeability and stability to cosmetics. 16.6.78 as 072916(6pp5).

SHIS ★ D21 10351C/06 ★ J5 4163-831
Powdery cosmetic compsn. - prep'd. by admixing mica-type powder, pigment and e.g. fat with volatile liq., extruding, cutting and drying
SHISEIDO KK 16.06.78-JA-072784
(26.12.79) A61k-07

Compsn. is prep'd. by (a) mixing 30-90 pts.wt. mica-type powder; (b) < 40 pts.wt. pigment and 5-30 pts.wt. oil and fat, surfactant and/or water soluble binder with volatile liq.; (b) extruding into a bar; (c) cutting; opt. (d) form-adjusting and processing; and (e) drying.

Pref. the volatile liq. is water or ethanol, esp. used as 15-40 w/w% on the sum of powdery components. Pref. water soluble binders include cellulose derivs., PVA, PVP, Mg aluminium silicate and Na magnesium silicate.

Up to 30-90 pts.wt. (a) (e.g. mica, titanium oxide-mica pearl agent, etc.) can be stably combined and the bar has high strength. When the prod. is applied with a spreading stick, it can be uniformly adhered to the head of the stick by rubbing. 16.6.78 as 072784(5pp5).

Diaper having absorbent cellulosic pad - with surface impregnated
with resin, cured to form porous matrix smooth surface
COLGATE PALMOLIVE CO 20.08.76-US-716094
A96 P32 + P21 (06.02.80) *US4050-463 A41b-13/02

Disposable diaper comprises a porous absorbent pad of
cellulosic fibres and water-impervious backing sheet
adjacent and bonded to one surface of the pad. The fibres
of the pad at the opposite surface are bonded together by

resinous binder. The bonded fibres form a porous matrix
defining the top surface of the diaper. Side margins of the
backing sheet are folded over and around respective side
edges of the pad and are adhered to the bonded fibres of
the top surface.

The binder is pref. an acrylic, alkyd, butyl, urethane
or vinyl resin. The basic wt. of the pad is 0.025-0.050
g/cm², its density under compression of 2,1 g/cm² is
0.06-0.140 g/cm³ and its density under 51.2 g/cm² is
0.105-0.210 g/cm³.

Conventional top sheet of the diaper is not required.
The resin bonding provides desired surface strength,
integrity, absorption and surface dryness. 11.8.77 as
033781 (4pp393).

Absorbent tampon for sanitary hygiene - in one piece with narrower
front section for easy insertion

HIRSCHMAN S Z 04.08.76-DT-635041 (26.07.76-GB-031129)

P32 (06.02.80) *DT2635-041 A61f-13/20

Female hygiene absorbent pad insertable entirely into the
interlabial space has integral posterior and anterior
parts symmetrical about a central axis defining pad
height. The anterior part is of smaller transverse cross-
section, and the axis is longer than the longest transverse
dimension of the posterior part.

The anterior part is wedge-shaped or has an axially
extending part of uniform transverse size much less than
the longest transverse dimension of the posterior part.
On insertion the anterior part faces the vestibule to facil-
itate pad insertion. The posterior part provides reliable
retention even after substantial absorption of fluid.

Sanitary towels, etc. comprising absorbent water swellable film - coated with water insoluble and impervious polymer to stop premature disintegration

DOW CHEMICAL CO 27.03.78-US-890159
A96 P32 P73 (A14 A82) (29.01.80) A61f-13/16 B32b-07/02

A disposable composite comprises an absorbent swellable film of a water-insoluble water-swellable polymer covered on both sides by a hydrophobic coating of a water-insoluble water-impervious polymer. The hydrophobic coating is resistant to moisture to prevent premature disintegration of the composite. The swellable film can absorb enough water to convert it to a weak expanded gel thereby breaking the hydrophobic coating into several pieces which separate from the film.

Used as a liner or packaging for sanitary napkins. The composite holds together in use, but disintegrates when flushed down the toilet.

The water swellable film is e.g. a lightly crosslinked polyacrylate, polyvinylpyrrolidone, sulphonated polystyrene, polysulphoethyl acrylate, poly-2-hydroxyethyl acrylate, hydrolysed polyacrylamide, acrylamide acrylic acid copolymer, polyvinyl morpholine, or an amide or salt of a copolymer of maleic anhydride with vinyl methyl ether, vinyl pyrrolidone, vinyl morpholine or an olefin. The hydrophobic coating is PVAc, PVdC, a polyacrylate or water-insoluble ethyl cellulose. 27.3.78 as 890159 (7pp)

Alpha-methyl alkyl-aldehyde perfumery component prepn. - by rhodium complex catalysed higher linear olefin hydroformylation and heat treatment of prod.

RUHRCHEMIE AG 31.07.78-DT-833538
E17 (06.02.80) C07c-45/50 C07c-47/02
D/S: E(BE, FR, GB)

Prepn. of aldehydes (I) of formula $\text{R}-\text{CHMe}-\text{CHO}$ (where R is 7-12C n-alkyl) comprises (i) reacting olefins (II) of formula $\text{R}-\text{CH}=\text{CH}_2$ with CO and H_2 at 80-170°C and 200-350 bar in the presence of complex Rh cpd. catalysts, added as such or formed under the reaction conditions from olefin-soluble Rh salts, organic phosphines, CO and H_2 , and (ii) heating the reaction prod. at 100-190°C, opt. after sepg. the catalyst.

(I) are used as components of perfumery compsns. In step (i), (II) are converted at high reaction rates and space-time yields to an isomer mixt. of n-aldehydes and α-methyl-aldehydes. In step (ii), the n-aldehydes are converted to less volatile higher mol. wt. condensn. prods. which are easily sepd. from (I) which remain unchanged. 24.7.79 as 102604 (10pp200)

RHON D23 38933B/20 =EP ---7-882
Allylic alcohol prepn. from allylic halide(s) - with recycling of alkali metal carboxylic acid salt; useful as perfumery ingredients and flavourants

RHON-POULENC INDUSTRIES 24.07.78-US-927330
E17 (D13) (06.02.80) *US4152-530 C07c-29/80 C07c-33/03
C07c-67/58 + C07c-27/02 C07c-67/10
D/S: E(BE, CH, DT, FR, GB, IT, NL).

Allyl alcohols (I) are made by first condensing an allyl halide (II) with an alkali carboxylate (III) in the presence of a nitrogen base (IV) as catalyst, to give an allyl carbonylate (V). (V) is then saponified with a base to give (I) and (III). In the first stage, (II) and (III) are condensed together at 50-150°C in the presence of (IV) in an anhydrous medium comprising a water-immiscible ketone (VI) which forms an azeotrope with water. Water is then added to the reaction mixt. to dissolve the alkali halide formed during the condensn. The aq. alkali halide soln. is sepd. from the ketone phase contg. (V).

Aq. alkali hydroxide soln. is added to the ketone phase to saponify (V) at 50-150°C. The organic and aq. phases are sepd. and (I) is recovered by distn. from the organic phase. The residual (VI) may be recycled. (VI) is added to the aq. soln. of (III) obtd. in the sepn. and the water is removed by azeotropic distn. The resulting suspension of (III) in (VI) is recycled to the condensn. phase.

The process operates without sepn. of the intermediate (III), which is recycled. Relatively simple appts. is used and there are no costly drying stages. (I) are intermediates for use in perfumes and aroma compsns.

20.7.79 as 420033 (18pp513).

A97 E17 (E34) (27.12.79) C11d-07/54

Compsn. contains sodium percarbonate (I) heat-treated at from 70°C for 10-120 mins to 110°C for 10-30 min., anhydrous alkali metal (bi)carbonate (II), and succinic acid, citric acid, and maleic acid (III) as essential components. The ratio of (II)-(III) (by wt.) is 0.6-5.0

The storage stability of the compsn.. The solubility of sodium percarbonate is improved without spoiling its stability by combining the heat-treatment of sodium percarbonate with the incorporation of anhydrous alkali (bi)carbonate in addn. to an acid such as succinic acid. 16.6.78 as 072789(6pp126).

Alkali phosphates with high degree of whiteness - where vanadium and iron are removed using sodium hydroxymethane-sulphinate (NL301276)

HOECHST AG 28.06.75-DT-528895

E34 (E12) (15.01.80) *DT2528-895 C01b-25/30

Alkali metal phosphate solns. with low vanadium contents are obtd. from wet process phosphoric acid which contains iron and vanadium. The metals are converted from the highest to a lower oxidn. state using hydroxymethane sul-

phinic acid as reductant. The acids are then neutralised with alkali metal lyes and/or carbonates to pH > 3, and the ppte. sepd. off.

Prof. a soln. of hydroxymethane sulphinic acid sodium salt in 10-30 wt.% natron lye is used as reductant. The Na salt is used as 600-1000 wt.% based on the vanadium present in the phosphoric acid. The prep'd. solns. are converted to condensed alkali metal phosphates (e.g. di- and tri-phosphates) for inclusion in washing agents. 25.6.76 as 006985 (3pp913)
